VLSI TECHNOLOGY, INC.

VL82C203

PC/AT-COMPATIBLE ADDRESS BUFFER

FEATURES

- Fully compatible with IBM PC/AT-type designs

- Completely performs address buffer function in IBM PC/AT-compatible systems

- Replaces several buffers, latches and other logic devices

- Supports up to 20 MHz system clock

- Device is available as "cores" for user-specific designs

- Designed in CMOS for low power consumption

DESCRIPTION

The VL82C203 PC/AT-Compatible Address Buffer provides the system with a 16-bit address bus input from the CPU to 41 buffered drivers. The buffered drivers consist of 17 bidirectional system bus drivers, each capable of sinking 24 mA (60 'LS loads) of current and driving 200 pF of capacitance on the backplane; 16 bidirectional peripheral bus drivers, each capable of sinking 8 mA (20 'LS loads) of current; and eight memory bus drivers, also capable of sinking 8 mA of current. On-chip refresh circuitry supports both

256K-bit and 1M-bit DRAMs. The VL82C203 provides addressing for the I/O slots as well as the system.

The device is manufactured with VLSI's advanced high-performance CMOS process and is available in a JEDEC-standard 84-pin plastic leaded chip carrier (PLCC) package. The VL82C203 is part of the PC/AT-compatible chip sets available from VLSI. Please refer to the Selector Guide in the front of this manual.
BLOCK DIAGRAM
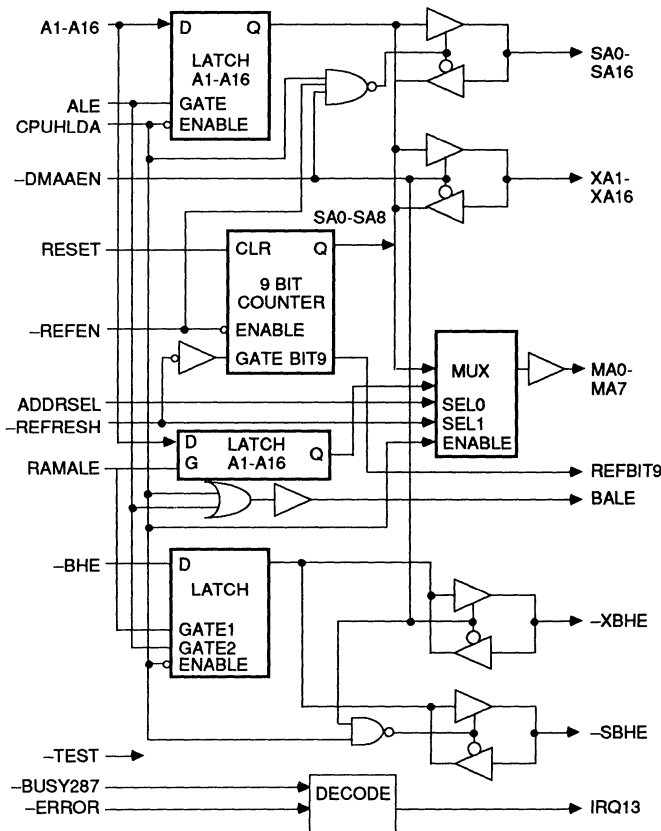

ORDER INFORMATION

Part Number	System Clock Freq.	Package
VL82C203-16QC VL82C203-16QI	16 MHz	Plastic Leaded Chip Carrier (PLCC)
VL82C203-20QC VL82C203-20QI	20 MHz	Plastic Leaded Chip Carrier (PLCC)

Note: Operating temperature range:
QC = 0°C to +70°C
QI = −40°C to +85°C.

SIGNAL DESCRIPTIONS

Signal Name	Pin Number	Signal Type	Signal Description
A1-A16	20-13, 9-2	I	CPU Address Bus Bits 1-16 - The lower 16 bits of the CPU address bits. These are multiplexed to the system address bus for the slots SA1-SA16, the memory address bus MA0-MA7, and the peripheral address bus XA1-XA16.
RAMALE	10	I	RAM Address Latch Enable - RAMALE is used to latch RAM address buffers. It is forced high at the end of any bus cycle. This allows the address for the next bus cycle to be passed to the system memory sooner than the ALE signal. RAMALE will go back low at the end of the status cycle for any bus cycle to latch the memory address until the end of the bus cycle. The memory address latches are open when RAMALE is in the high state.
–BUSY287	11	I	Busy 287 - This active low input is asserted by the 80287 to indicate that it is currenty executing a command.
–BHE	12	I	Bus High Enable - This is the active low input signal from the 80286 microprocessor which is used to indicate a transfer of data on the upper byte on the data bus, D8-D15.
ALE	22	I	Address Latch Enable - This positive edge input controls the address latches which hold the address during a bus cycle. ALE is not issued for a halt bus cycle. All latches are open when ALE is in the high state.
CPUHLDA	23	I	CPU Hold Acknowledge - This active high input indicates ownership of the local CPU bus. When high, this signal indicates that the CPU has three-stated its bus drivers in response to a hold request. When low, it indicates that the CPU bus drivers are active.
–DMAAEN	24	I	DMA Address Enable - This is an active low input which is active whenever an I/O device is making a DMA access to the system memory.
–REFRESH	25	I	Refresh - An active low input which is used to initiate a refresh cycle for the dynamic RAMs. It is used to clock a refresh counter which provides addresses during the refresh cycle.
–REFEN	26	I	Refresh Enable - An active low input that will be asserted when a refresh cycle is needed for the DRAMs.
ADDRSEL	27	I	Address Select - This is a multiplex select for the memory address bus drivers. When ADDRSEL is low, the lower order address bits are selected. When high, the high order address bits are selected.
RESET	28	I	Reset - This active high input signal is the system reset generated from a POWERGOOD. It is synchronized to PROCCLK and used to reset the refresh counter.
–ERROR	29	I	Error - This is an active low input which indicates an error has occurred within the 80287 coprocessor.
REFBIT9	30	I	Refresh Bit 9 - This is the MSB of the refresh counter. When used with the Memory Controller chip a refresh address will be generated for 1M byte DRAMs.
–TEST	31	I	Test - This is an active low input which is used to three-state all outputs of the VL82C203 device. This is for system level test where it is necessary to overdrive the outputs of the VL82C203. When –TEST is low, all outputs and bidirectional pins of the VL82C203 will be three-stated. This pin should be pulled up via a 10K Ω pull-up resistor in a standard system configuration.

4

SIGNAL DESCRIPTIONS (Cont.)

Signal Name	Pin Number	Signal Type	Signal Description
–SBHE	32	I/O	System Bus High Enable - This is the system I/O signal used to indicate transfer of local data on the upper byte on the local data bus, D8-D15. –SBHE is active low and will be in input mode during bus hold acknowledge.
SA0-SA16	53-50, 48-45 43-40, 38-34	O	System Address Bus Bits 0-16 - SA0 will be active only during a refresh cycle otherwise it will be three-stated (input mode).
BALE	55	O	Buffered Address Latch Enable - An active high output that is used to latch valid addresses and memory decodes from the 80286. System addresses SA0–SA16 are latched on the falling edge of BALE. During a DMA cycle BALE is forced active high.
MA0-MA7	57-64	O	DRAM Memory Address Bus Bits 0-7 - This 8-bit output is multiplexed using ADDRSEL to give a full 16-bit address.
XA1-XA16	83-76, 74-67	I/O	Peripheral Address Bus Bits 1-16 - These I/Os are used to control the coprocessor, keyboard, ROM memory and the DMA controllers.
–XBHE	66	I/O	Transfer Byte High Enable - This is an active low I/O used to allow the upper data byte to be transferred through the bus transceivers.
IRQ13	84	O	This is an active high output which indicates an error has occurred within the 80287 coprocessor.
VDD	1, 44, 56		System Supply: 5 V
VSS	21, 33, 39 49, 54, 65, 75		System Ground

FUNCTIONAL DESCRIPTION

The VL82C203 is part of a five chip set which together perform all of the on-board logic required to construct an IBM PC/AT-compatible system. The PC/AT-Compatible Address Buffer replaces several bus transceivers and address data latches located within the PC/AT-type system. The DRAM refresh circuitry is also located on this device.

The primary function of the Address Buffer is to multiplex the 80286 micro-processor address lines (A1-A16) to the system address bus (SA0-SA16), the peripheral address bus (XA1-XA16), and the memory address bus (MA0-MA7). This is accomplished through positive edge triggered latches and a group of data multiplexers. The two groups of latches can be seen in the block diagram of the device. One set of latches have their output enabled with CPUHLDA and are gated with ALE. This set of latches drive the SA and XA bus outputs. Another parallel set of latches are multiplexed into the MA

lines and are gated with RAMALE. RAMALE is an early ALE signal. This allows more setup time for the address to be multiplexed to the DRAMs. If the VL82C203 is not used in conjunction with the other PC/AT-devices, RAMALE and ALE should be wired together to provide maximum PC/AT-compatibility.

The device also provides for address flow between the SA, XA, and MA buses and the –XBHE and –SBHE signals. The –XBHE signal is gated with the RAMALE input while the –SBHE is gated with the ALE input. This control flow is arbitrated with the CPUHLDA, –DMAAEN, and –REFEN inputs and is shown in Table 1.

TABLE 1. INTERNAL BUS CONTROL DECODE

CPU HLDA	–DMA AEN	–REF EN	A	SA	XA	MA	–XBHE	–SBHE
0	X	X	I	O	O	O	O	O
1	0	1	I	O	I	O	I	O
1	1	0	I	O	O	O	O	I
1	1	1	I	I	O	O	O	I

I = Input Mode
O = Output Mode
X = Don't Care

Memory addresses are multiplexed from the SA and A bus sources and are controlled via the CPUHLDA, –REFRESH, and ADDRSEL inputs. The mapping and control is shown in Table 2.

A 9-bit refresh counter is provided on this device. This allows support for DRAMs of up to 1M bit in size. The refresh counter is clocked on the rising edge of the –REFRESH input. A latched register inside the counter latches in the current state of the counter on the falling edge of –REFEN and transfers this value to the internal bus which routes to the SA and MA bus outputs. The SA0 output is provided only for refresh purposes and is driven only during this time. During a refresh the SA and MA bus outputs are driven from the output of the refresh counter latch Q0-Q8. Refer to Table 3 for the mapping of the refresh counter to the bus lines.

Note that all SA bus lines are driven during a refresh cycle. ADDRSEL is not normally toggled during a refresh cycle but is shown in Table 3 for completeness of the logic implementation. The REFBIT9 signal is the Q8 output of the refresh counter. This is required only for the refresh of 1M bit DRAMs.

TABLE 2. MEMORY ADDRESS MAPPING

Mux Control Input			MA Bus	
CPUHLDA	–REFRESH	ADDRSEL	MA7	MA0-MA6
1	0	0	SA8	SA1-SA7
1	0	1	SA16	SA9-SA15
0	X	0	A8	A1-A7
0	X	1	A16	A9-A15

X = Don't Care

TABLE 3. REFRESH ADDRESS MAPPING

Mux Control Input			MA Bus		SA Bus	
CPU HLDA	–REF EN	ADDR SEL	MA7	MA0- MA6	SA9- SA15	SA0- SA8
1	0	0	Q0	Q1-Q7	0	Q0-Q8
1	0	1	0	0	0	Q0-Q8

The –TEST pin has been added to enhance system level testing of the VL82CPCAT-16/-20 chip sets. When this pin is active (0), all outputs and bidirectional pins are placed in three-state.
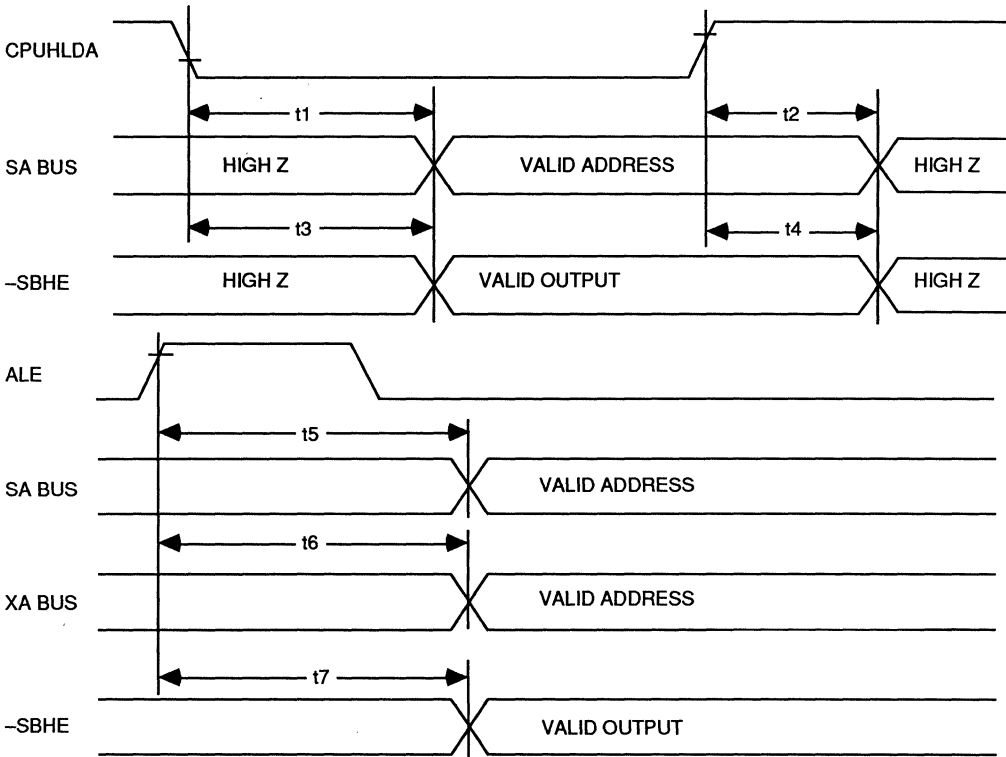

This allows a board level test system to overdrive outputs of the VL82C203 without damage to the device. When –TEST is active, the internal bus is driven to the state of the system address bus (SA0-SA16).
