Rhine III 10 / 100 Mbps PCI Fast Ethernet Controller with ACPI Functions

PRODUCT FEATURES

- **Single Chip Fast Ethernet Network Interface Controllers (NICs) for the PCI Bus**
 - PCI 2.2 specification compliant
 - Provide a direct connection to the PCI bus
 - Support 10 / 100 Mbps ethernet communications with BootROM interface
- **High Performance PCI Mastering Structure**
 - VIA-defined 256 byte I/O-based or memory-mapped-I/O-based command and status registers
 - Software oriented chain structure description to minimize hardware complexity
 - On chip bus master DMA with programmable burst length for high PCI bus utilization
 - Transmit data buffer byte-alignment for low CPU utilization
 - Dynamic transmit packet auto-queuing for back-to-back transmission
 - Programmable activity polling intervals for description DMA
 - Programmable DMA arbitration priority to minimize overflow under flow conditions
 - Early receive and early transmit interrupts for software parallel processing
 - Interrupt controllable by receive/transmit descriptor list for saving interrupt service time
 - PCI enhance command capable
- **Provides Standard 100Base-Tx/ PHY Layer and Transceiver**
 - Supports 100Base-TX with CAT5 UTP, STP and fiber cables
 - 10 / 100 Mbps full duplex, half duplex operation
 - Auto MDI / MDIX functions N-Way enable or PHY force-media mode
 - Auto Power-saving at cable not link
 - Four LED outputs, including Link, Duplex, Speed, and Collision status
- **Separate 2K Byte Receive and Transmit FIFOs**
 - Both support bursts of up to full Ethernet length
 - Programmable receive and transmit FIFO threshold control for optimize PCI throughput
- **Flexible Dynamic-Load EEPROM Algorithm**
 - Load after power-up
 - Dynamic auto reload
 - Embedded programming for configuration modification
 - Dynamic direct programming for manufacturing
- **External Boot ROM**
 - Up to 64K Bytes
 - No external address latch required
 - Supports EPROM read and Flash ROM read / write
- **ACPI**
 - Supports PC99, PC2001 and Net PC requirements
 - Supports PCI Bus Power Management Interface Specification Version 1.0 / 1.1
 - Supports Advanced Configuration and Power Interface (ACPI) Specification 1.0
 - Supports Network Device Class Power Management Specification Version 1.0a
 - Wake-up even support link change / magic packet / unicast physical address / MS define pattern match

- **Flow Control**
 - Supports IEEE 802.3X for full duplex
 - Multiple pause frame Xon / Xoff
- **Dual Power Design: 3.3V I/O Power and 2.5V Core Power**
- **0.22um TSMC CMOS Technology**
- **128-Pin PQFP Package (14x20mm Rectangular Package Body)**

OVERVIEW

The VIA VT6105 “Rhine III” Ethernet controller is a cutting edge, feature-rich, and cost-competitive single ASIC chip solution for PC NIC adapters. The VT6105 eases server processor utilization by optimizing throughput between the NIC and PCI bus allowing data transfers of up to at 200Mbps in full duplex mode, without using the system CPU. The VT6105 features extensive troubleshooting features including auto MDI / MDIX configuration and remote BootROM ability. The VT6105 also contains advanced power management features for low power consumption including Wake on LAN (WOL) and is implemented using a low power 0.22 micron design.

The VIA VT6105 is ideal for integration into network controllers, network workstations, NICs, or LAN-on-motherboard solutions, providing a manageable, integrated controller to bring high speed Ethernet connectivity to the electronics of tomorrow.

Pin Descriptions
Table 2. Pin Descriptions

PCI Bus Interface			
Signal Name	Pin #	I/O	Signal Description
AD[31:0]	(see pin list)	I/O	Address and Data. Address and data are multiplexed on the same PCI pins. A bus transaction consists of an address phase followed by one or more data phases. The address phase is the clock cycle in which FRAME# is asserted. In the data phase of the clock cycle IRDY# and TRDY# are both asserted. Write data is stable and valid when IRDY# is asserted and read data is stable and valid when TRDY# is asserted.
CBE#[3:0]	6, 18, 28, 39	I/O	Bus Command / Byte Enable. These commands are multiplexed on the same PCI pins. During the address phase of a transaction, CBE#[3:0] defines the Bus Command. During the data phase, CBE#[3:0] uses the Byte Enable command. The Byte Enables define which physical byte lanes on the bus carry the data. CBE#[0] applies to byte 0 and CBE#[3:0] applies to byte 3.
PAR	27	I/O	Parity. Even parity across AD[31-0] and CBE#[3-0]. PAR is stable and valid one clock after the address phase. For data phases PAR is stable and valid one clock after either IRDY# is asserted on a write transaction or TRDY# is asserted on a read transaction.
IDSEL	8	I	Initialization Device Select. Used as a chip select during PCI configuration read and write-cycles.
FRAME#	19	I/O	Frame. Cycle Frame is driven by the current bus master to indicate the address stage that marks the beginning and duration of a bus transaction. During the address stage the FRAME# is asserted low to indicate that a bus transaction is beginning. While the FRAME# is asserted, data transfers continue. When the FRAME# is negated, the transaction is in the final data phase.
DEVSEL#	23	I/O	Device Select. When actively driven, indicates the driving device has decoded its address as the target of the current access. As an input, DEVSEL# indicates whether any device on the bus has been selected.
IRDY#	21	I/O	Initiator Ready. Indicates the initiating agent's ability to complete the current data phase of the transaction. IRDY# is used in conjunction with TRDY#. A data phase is completed on any clock when both IRDY# and TRDY# are asserted. During a write cycle, IRDY# indicates that transferring data is present on AD[31:0]. During a read cycle, it indicates the master is prepared to accept data. Wait cycles are inserted until both IRDY# and TRDY# are asserted simultaneously.
TRDY#	22	I/O	Target Ready. Indicates the target agent's ability to complete the current data phase of the transaction. TRDY# is used in conjunction with IRDY#. A data phase is completed on any clock when both IRDY# and TRDY# are asserted. During a read, TRDY# indicates that valid data is present on AD31-0. During a write, it indicates the target is prepared to accept data. Wait cycles are inserted until both IRDY# and TRDY# are asserted simultaneously.
STOP#	25	I/O	Stop. The VT6105 drives STOP# to discontinue further action.
PERR#	26	I/O	Parity Error. Asserts when a data parity error is detected.
REQ#	122	O	Bus Request. Asserted by the VT6105 indicate to the PCI bus arbiter that it wants to use the bus for bus master operations.
GNT#	121	I	Bus Grant. Asserts to indicate to the VT6105 that access to the bus is granted.
INTA#	117	OD	Interrupt. An asynchronous signal used to request an interrupt
PCICLK	119	I	PCI Clock. Provides timing for all transactions on the PCI bus and is an input pin to every PCI device.
PCIRST#	118	I	PCI Reset. When PCIRST# is asserted low, the VT6105 chip performs an internal system hardware reset. PCIRST# may be asynchronous to PCICLK when asserted or negated, but it is recommended that the negation be synchronous to guarantee a clean and bounce-free signal edge.

Boot ROM / EEPROM Interface				
<u>Signal Name</u>	<u>Pin #</u>	<u>I/O</u>	<u>Signal Description</u>	
MA[15:0]	(see pin list)	O	Boot ROM Address.	
BPWR#	55	O	Boot ROM Write Enable. Used to write to the Boot ROM if it is writable (flash).	
BPRD#	56	O	Boot ROM Read Enable. Used to read Boot ROM data on the memory data bus.	
BPCS#	57	O	Boot ROM Chip Select. Used to select the Boot ROM for a read or write.	
MD7	67	IO	Boot ROM Data Bus / Serial EEPROM Control.	
MD6	66	IO		
MD5	65	IO		
MD4	64	IO		
MD3	63	IO		
MD2 / EECK	62	IO / O		EECK = Serial EEPROM Clock.
MD1 / EEDI	61	IO / I		EEDI = Serial EEPROM Data In.
MD0 / EEDO	58	IO / O		EEDO = Serial EEPROM Data Out.
EECS	54	O	Serial EEPROM Chip Select. Chip select signal for an external serial EEPROM when an EEPROM is used to provide the configuration data and Ethernet Address. A 100K pull-up resistor should be connected.	

LED Interface			
<u>Signal Name</u>	<u>Pin #</u>	<u>I/O</u>	<u>Signal Description</u>
LED3 / strap	91	O / I	LED Identification. LED displays for network traffic status identification. The LED select bits in PHY register Rx10 can be used to set the LED definitions. The default LED definitions are: LED0: Link/Act LED1: Speed LED2: Duplex LED3: Collision The LED0 and LED3 pins are also used as power-up straps: LED0 strap = Test Mode (0 = Internal PHY test mode, 1 = normal operation) LED3 strap = N-Way Enable (0 = disable, 1 = enable) Both strap pins may be strapped low to force "fiber" mode"
LED2	92	O	
LED1	93	O	
LED0 / strap	94	O / I	

Power Management Interface			
<u>Signal Name</u>	<u>Pin #</u>	<u>I/O</u>	<u>Signal Description</u>
WOL	116	O	Wake on LAN Event. Active high, programmable pulse or button WOL event
PME#	123	OD	Power Management Event. Power management interrupt output

Physical Cable Connection			
<u>Signal Name</u>	<u>Pin #</u>	<u>I/O</u>	<u>Signal Description</u>
TX+, TX-	112,113	IO	Differential Transmit Pair.
RX+, RX-	108,109	IO	Differential Receive Pair.
SD+, SD-	104,105	I	Differential Signal Detect.

Clocks, Control and Test			
<u>Signal Name</u>	<u>Pin #</u>	<u>I/O</u>	<u>Signal Description</u>
XI	99	I	Crystal In. Connect to 25 MHz crystal with (22pF 5%) pF capacitor connection to GNDOSC. Can alternately be driven by an external clock source (3.3V voltage swing) with XO unconnected.
XO	98	O	Crystal Feedback. Connect to other side of 25 MHz crystal and to 22pF 5% GNDOSC capacitor.
REXT	102	I	External Resistor. Connect 6.04 K Ω 1% resistor.
GPI	88	I	General Purpose Input Pin.
TESTM0	89	I	Test and Operation Mode Select 0.
TESTM1	90	I Pull Low	Test and Operation Mode Select 1.

Digital Power and Ground			
<u>Signal Name</u>	<u>Pin #</u>	<u>I/O</u>	<u>Signal Description</u>
VCC33	7, 20, 32, 44, 60, 71, 86, 124	P	I/O Power. +3.3V \pm 5%
VCC25	115, 53	P	Core Power. +2.5V \pm 5%
GND	1, 13, 24, 35, 45, 52, 59, 72, 85, 114, 120	P	Digital Ground. Connect directly to main PCB ground plane.
VCCRAM	47	P	Power for Internal FIFO SRAM. +2.5V \pm 5%
GNDRAM	46	P	Ground for Internal FIFO SRAM. Connect directly to main PCB ground plane.

Analog Power and Ground			
<u>Signal Name</u>	<u>Pin #</u>	<u>I/O</u>	<u>Signal Description</u>
VCCA	95	P	Analog Power. 2.5V \pm 5% power for internal analog circuitry.
GND A	96	P	Analog Ground. Connect to analog ground.
VCCTX	110	P	PHY Transmitter Power. 2.5V \pm 5% power for internal PHY transmitter circuitry.
GNDTX	111	P	PHY Transmitter Ground. Connect to analog ground.
VCCR X	107	P	PHY Receiver Power. 2.5V \pm 5% power for internal PHY receiver circuitry.
GNDRX	106	P	PHY Receiver Ground. Connect to analog ground.
VCCREXT	101	P	External Resistor Circuit Power. 2.5V \pm 5% power for internal analog circuitry associated with the external resistor REXT.
GNDREXT	103	P	External Resistor Circuit Ground. Connect to analog ground.
VCCXTAL	100	P	Crystal Oscillator Power. 2.5V \pm 5% power for internal crystal oscillator circuit.
GNDXTAL	97	P	Crystal Oscillator Ground. Connect to analog ground.

REGISTERS

Register Overview

The tables in this section describe the register settings for the VT6105. The registers in this section are listed according to their offset values. The tables show the Access Type (Read/Only, Read/Write, and Read/Write/Clear) and power-on default values ("Default"). All offset values are shown in hexadecimal unless otherwise indicated. Default values for each register are also indicated in hexadecimal notation.

Note: Registers indicated as RW may have some read/only bits that always read back a fixed value (usually 0 if unused); registers assigned as RWC or WC may have some read-only or read-write bits (see individual register descriptions for details)

Register Summary

Table 3. Register Summary Tables

PCI Configuration Registers

Offset	Configuration Space Header	Default	Acc
1-0	Vendor ID	1106	RO
3-2	Device ID	3106	RO

Register Descriptions

PCI Configuration Registers

Offset 1-0 - Vendor ID (1106h)..... RO

15-0 ID Code (reads 1106h to identify VIA Technologies)

Offset 3-2 - Device ID (3106h) RO

15-0 ID Code (reads 3106h to identify the VT6105)

Offset 5-4 - Command (0006h) RW

- 15-10 Reserved always reads 0
- 9 Fast Back-to-Back Enable always reads 0
- 8 SERR# Enable always reads 0
- 7 Wait Cycle Control always reads 0
- 6 Parity Error Response always reads 0
- 5 VGA Palette Snoop always reads 0
- 4 Memory Write & Invalidate Enable. always reads 0
- 3 Special Cycles Enable always reads 0
- 2 PCI Bus Master Enable always reads 0
- 1 Memory Space Enable always reads 0
- 0 I/O Space Enable always reads 0

Offset 7-6 - Status (0290h)RWC

- 15 Detected Parity Error always reads 0
- 14 Signaled System Error always reads 0
- 13 Received Master Abort always reads 0
- 12 Received Target Abort always reads 0
- 11 Signaled Target Abort always reads 0
- 10-9 DEVSEL# Timing
 - 00 Fast
 - 01 Mediumalways reads 01
 - 10 Slow
 - 11 Reserved
- 8 Data Parity Error Detected always reads 0
- 7 Fast Back-to-Back Capablealways reads 1
- 6 User Definable Features always reads 0
- 5 66 MHz Capable always reads 0
- 4 Power Management Capabilitiesalways reads 1
- 3-0 Reserved always reads 0

Offset 8 - Revision ID (nnh) RO

7-0 Revision IDalways reads current chip revision #

Offset B-9 - Class Code..... RO

Identifies the generic function of the device and specific register-level programming interfaces.

31-8 Class Codedefault = 00 00 00h

Offset C - Cache Line Size..... RW

Implemented by master devices that are able to generate the memory write command as well as the memory invalidate command.

7-0 Cache Line Sizedefault = 00h

Offset D - Latency Timer RW

Implemented as write able by a master device that can burst more than two data phases.

7-0 Latency Timerdefault = 00h

Offset E - Header Type..... RO

Refer to the PCI version 2.1 Specification.

7-0 Header Typedefault = 00h

Offset F - Built In Self Test (BIST) (00h)..... RO

7-0 BISTdefault = 00h

Offset 34 - Capability Pointer RO

Provides an offset into the function's PCI configuration space for the location of the first item in the Capabilities linked list

7-0 Capability Pointerdefault = 00h

Offset 41 - Next Item Pointer RO

Provides an offset into the function's PCI configuration space pointing to the location of the next item in the function's capability list

7-0 Next Item Pointerdefault = 00h

Offset 43-42 - Power Management Event RO

15-11 PME_Supp RO

This 5 bit field indicates the power state in which the function may assert PME#.

- 1xxxx PME# can be asserted from D3cold
- x1xxx PME# can be asserted from D3hot
- xx1xx PME# can be asserted from D2
- xxx1x PME# can be asserted from D1
- xxxx1 PME# can be asserted from D0

10-0 Reservedalways reads 0

Offset 4F-44 - Power Management Control Status..... RWC

Refer to Power Management spec 1.0.

Internal Registers

Offset 5-0 - Ethernet Address..... RW

63-0 Ethernet Address.....PAR0-PAR5
Loaded from EEPROM at power up

Offset 6 - Receive Configure Request RW

- 7-5 Receive FIFO Threshold**
 - 000 64 byte..... default
 - 001 32 byte
 - 010 128 byte
 - 011 256 byte
 - 100 512 byte
 - 101 768 byte
 - 110 1024 byte
 - 111 store & forward
- 4 Physical Address Packets Accepted**
 - 0 Physical address must match node address in PAR0-5.
 - 1 All packets with physical destination address are accepted
- 3 Broadcast Packets Accepted**
 - 0 Packets with broadcast address are rejected
 - 1 Packets with broadcast address are accepted
- 2 Multicast Packets Accepted**
 - 0 Packet with multicast are rejected
 - 1 Packets with multicast address hit hashing table defined by MAR0-MAR7 are accepted
- 1 Runt Packets Accepted**
 - 0 Packets smaller than 64 bytes are rejected.
 - 1 Packets smaller than 64 bytes are accepted.
- 0 Error Packets Accepted**
 - 0 Reject Packets with CRC error
 - 1 Accept Packets with CRC error

Offset 7 - Transmit Configure Request RW

- 7-5 Transmit FIFO Threshold (Mode10T)**
 - 000 128 byte----(64 byte)..... default
 - 001 256 byte----(128 byte)
 - 010 512 byte----(256 byte)
 - 011 1024 byte---- (512 byte)
 - 1xx store & forward
- 4 ReservedRO**
- 3 Back-Off Priority Select**
 - 0 If OFFSET =0, enable VIA back off algorithm
 - 1 If OFFSET =1, enable National compatible algorithm
- 2-1 Transmit Loopback Mode**
 - 00 Normal
 - 01 Internal loopback (MAC only)
 - 1x Reserved
- 0 Reserved RO**

Offset 8 - Control 0 RW

- 7 Reservedalways reads 0**
- 6 Receive Poll DemandSelf Clearing**
 - 0 Toggle bit..... default
 - 1 Set 1 to poll the RD once. It will be cleared automatically after polling is completed.
- 5 Transmit Poll DemandSelf Clearing**
 - 0 Toggle bit..... default
 - 1 Set 1 to poll the TD once, it will be cleared by itself after polling complete.
- 4 Transmit Process**
 - 0 Transmit state disabled default
 - 1 Transmit DMA state enabled
- 3 Receive Process**
 - 0 Receive state disabled default
 - 1 Receive DMA state enabled
- 2 Stop NIC**
 - 0 Command processing is in process default
 - 1 Shut down NIC operation
- 1 Start NIC**
 - 0 Command not entered..... default
 - 1 Enable NIC operation
- 0 Reserved R0**

Offset 9 - Control 1 RW

- 7 Software Reset**
 - 0 Normal condition default
 - 1 Software reset (cleared after reset complete)
- 6-4 Reservedalways reads 0**
- 3 Disable TD/RD Auto Polling**
 - 0 Set TX/RX auto-polling enable default
 - 1 Set TX/RX auto polling disable
- 2 Full Duplex**
 - 0 Set MAC to half duplex mode default
 - 1 Set MAC to full duplex mode
- 1 Disable Accept Unicast Packet**
 - 0 Accept the incoming packet destined to the VT6105 MAC Address..... default
 - 1 Reject the incoming packet destined to the VT6105 MAC Address
- 0 Early Receive Enable**
 - 0 Disable early receive mode..... default
 - 1 Enable early receive mode

Offset 0C - ISR0..... RW

- 7 **Reserved** always reads 0
- 6 **PCI Bus Error**default is 0
- 5 **Receive Buffer Link Error**default is 0
- 4 **Transmit Buffer Underflow**.....default is 0
- 3 **Transmit Error**
 - 0 Packet transmission with no errors..... default
 - 1 Packet transmission is aborted due to Excessive collision /underflow/ TD error
- 2 **Receive Error**
 - 0 Packets received with no errors..... default
 - 1 Packet received with the following errors: CRC./frame alignment/overflow/RD errors
- 1 **Transmitted Packet Successful**default is 0
- 0 **Received Packet Successful**default is 0

Offset 0D - ISR1..... RW

- 7 **General Purpose Interrupt**.....default is 0
- 6 **Port State Change**default is 0
- 5 **Excessive Collision Transmit Abort**default is 0
- 4 **RD running up**.....default is 0
- 3 **Receive FIFO Queue List overflow**.....default is 0
- 2 **Receive FIFO Overflow**default is 0
- 1 **Transmit FIFO Underflow Event**default is 0
- 0 **Early Receive Interrupt**.....default is 0

Offset 0E - Interrupt Mask 0 (00h)..... RW

All bits correspond to the bits in the ISR0 register.

Offset 0F - Interrupt Mask 1 (00h)..... RW

All bits correspond to the bits in the ISR0 register.

Offset 17-10 - Multicast Address..... RW

- 63-0 **Multicast Address Hash Table MAR0- MAR7**

Offset 1B-18 - Receive Descriptor Base Address RW

- 31-0 **Receive Descriptor List Starting Address**

Offset 1F-1C - Transmit Descriptor Base Address..... RW

- 31-0 **Transmit Descriptor List Starting Address**

Offset 6C - MII Configuration (MII_CFG)..... RW

- 7-6 **MII Management Polling Timer Interval**
 - 00 1024 Management Data Clock cycles.... default
 - 01 512 Management Data Clock cycles
 - 10 128 Management Data Clock cycles
 - 11 64 Management Data Clock cycles
- 5 **Accelerate Management Data Clock Speed**
 - 0 Management Data Clock=normal default
 - 1 Management Data Clock=4X accelerating
- 4-0 **Extend PHY Device Address**
Store bytes from EEPROM loading during power up or EEPROM auto-reloading. The registers can be programmed by software. default is 00001

Offset 6D – MII Status (MIISR)..... RW

- 7 **Software PHY Reset**default = 0
- 6 **Asm_Pause Status after N-Way**default = 0
- 5 **Pause Status after N-Way**default = 0
- 4 **Link Status after N-Way**
 - 0 Link Success default
 - 1 No cable connected
- 3 **PHY Device Received Error**default = 0
- 2 **Duplex Mode after N-Way**..... **RO**
 - 0 Half Duplex default
 - 1 Full Duplex
- 1 **Link Fail**..... **RO**
 - 0 Link Success default
 - 1 link failed
- 0 **PHY Speed**
 - 0 Speed is 100 Mbps..... default
 - 1 Speed is 10 Mbps

Offset 6E – Bus Control 0 (BCR0)..... RW

- 7-6 **Reserved**always reads 0
- 5-3 **Receive FIFO Threshold Control**
 - 000 Threshold determined by Receive Configuration Request Register Rx06 ... default
 - 001 32 byte
 - 010 128 byte
 - 011 256 byte
 - 100 512 byte
 - 101 768 byte
 - 110 1024 byte
 - 111 store & forward
- 2-0 **DMA Length**
 - 000 32 bytes (8 Double Words) default
 - 001 64 bytes (16 Double Words)
 - 010 128 bytes (32 Double Words)
 - 011 256 bytes (64 Double Words)
 - 100 512 bytes (128 Double Words)
 - 101 1024bytes (256 Double Words)
 - 11x Store & forward

Offset 6F – Bus Control 1 (BCR1) RW

- 7-6 **Reserved** always reads 0
- 5-3 **Transmit FIFO Threshold Control**
 - 000 Threshold determined by Control Registers 0-1 at Rx8-9 (Made 10T) default
 - 001 256byte — 128 byte
 - 010 512byte — 256 byte
 - 011 1024 byte — 512 byte
 - 1xx store & forward
- 2 **Polling Time Interval 2** default is 1
- 1 **Polling Time Interval 1** default is 1
- 0 **Polling timer interval 0** default is 0

Offset 70 – MII Control (MIICR)..... RW

- 7 **MII Management Port Auto Polling Enable**
 - 0 Disable
 - 1 Enable default
- 6 **PHY Read Enable** **Self-Clearing**
Reset when read is complete.
PHY Status is Stored in Rx72.
- 5 **PHY Write Enable**..... **Self-Clearing**
Reset when write is complete
- 4 **Direct Programming Mode**
 - 0 Enable default
 - 1 Disable (R/W commands have no effect)
- 3 **MDIO Output Enable Indicator**
- 2 **Direct Programming Status as Management Port Data Out**
- 1 **Direct Programming Input While Read PHY Status**
- 0 **Direct Programming Status as Management Port Clock**

Offset 71 - Management Interface Address RW

- 7 **MII Idle** **RO**
 - 0 MII auto polling cycle..... default
 - 1 Not at MII auto polling cycle
- 6 **MII Status Change Enable**
 - 0 Open the Pause Function of MII Polling Cycle Done (MDONE) default
 - 1 Close the Pause Function of MDONE
- 5 **Pause Status / Control**
When MDIO Auto Polling Data is Ready, MII State of SM is at the End of an Auto Polling Cycle
- 4 **MII Management Port Address Bit 4** default = 0
- 3 **MII Management Port Address Bit 3** default = 0
- 2 **MII Management Port Address Bit 2** default = 0
- 1 **MII Management Port Address Bit 1** default = 0
- 0 **MII Management Port Address Bit 0** default = 1

Offset 73-72 - MII Read / Write Data Port RW

- 15-0 **Data Scratch Field of Read Write Process on PHY Map Register**

Offset 74 – EEPROM Control / Status (EECSR) RW

- 7 **EEPROM Programmed Status** RO
A value of 73H indicates programmed
- 6 **Reserved** always reads 0
- 5 **Dynamic Reload EEPROM Content**
- 4 **Direct Program EEPROM Mode**
- 3 **Direct Program EECS Chip Select Pin Status**
- 2 **Direct Program EECK Clock Pin Status**
- 1 **Direct Program EEDI Data In Pin Status**
- 0 **Direct Program EEDO Data Out Pin Status** RO

Offset 78 - Chip Configuration A (CFG_A) RW

Note: This register always reads 00h after power is on and loading starts.

- 7 **EEPROM Embedded & Direct Programming**
 - 0 Disable default
 - 1 Enable
- 6 **MII Option** MIIOPT
 - 0 Without extension clock default
 - 1 With extension clock.
- 5 **Reserved**always reads 0
- 4-3 **LED Select**

	<u>LED0</u>	<u>LED1</u>	<u>LED2</u>	<u>LED3</u>
00	Link/Act	Speed	Duplex	COLdef
01	Pwr/TxAct	Link/RxAct	Speed	Duplex
10	Speed10	Speed10	Act	Duplex
11	Pwr/TxAct	Link/RxAct	Speed	COL
- 2-0 **Reserved**always reads 0

Offset 79 - Chip Configuration B (CFG_B)..... RW

- 7 **Transmit Frame Queuing**
 - 0 Enable default
 - 1 Disable
- 6 **Data Parity Generation and Checking**
 - 0 Enable default
 - 1 Disable
- 5 **Memory Read Line Support**
 - 0 Enable default
 - 1 Disable
- 4 **Transmitting FIFO DMA Will Interleave to Receiving FIFO DMA after 32 DWORD Transaction**
- 3 **Arbitration Priority Select**
The TX FIFO DMA will be interleave to RX FIFO DMA after 32 DWORD transaction
- 2 **Master Read Insert One Wait State 2-2-2-2**
 - 0 Disable default
 - 1 Enable
- 1 **Master Write Insert One Wait State 2-2-2-2**
 - 0 Disable default
 - 1 Enable
- 0 **Latency Timer**
 - 0 Disable default
 - 1 Enable

Offset 7A - Chip Configuration (CFG_C)..... RW

- 7 **Reserved** always reads 0
- 6 **Tie Unused Boot ROM Address MA High**
 - 0 Disable..... default
 - 1 Enable
- 5 **Delay Transaction During Boot ROM Read**
 - 0 Disable..... default
 - 1 Enable
- 4 **Reserved** always reads 0
- 3 **Boot ROM Timing Select**
 - 0 Fast default
 - 1 Slow
- 2-0 **Boot ROM Size Select**
 - 000 No Boot ROM default
 - 001 8K size
 - 010 16K size
 - 011 32K size
 - 1xx 64K size

Offset 7B - Chip Configuration D (CFG_D) RW

- 7 **Memory Mapped IO Access**
 - 0 Disable
 - 1 Enable..... default
- 6 **Diagnostic Mode**
 - 0 Disable..... default
 - 1 Enable
- 5 **Reserved** always reads 0
- 4 **Reserved for Test (Do Not Program)..... default = 0**
- 3 **Random Backoff Algorithm**
 - 0 Disable..... default
 - 1 Enable
- 2-0 **Reserved for Test (Do Not Program)..... default = 0**

Offset 80 - Miscellaneous Control (CR0)..... RW

- 7-5 **Reserved** always reads 0
- 4 **Transmit Full-Duplex Flow Control**
 - 0 Disable..... default
 - 1 Enable
- 3 **Receive Full-Duplex Flow Control**
 - 0 Disable..... default
 - 1 Enable
- 2 **Half-Duplex Flow Control**
 - 0 Disable..... default
 - 1 Enable
- 1 **Timer 0 Suspend.....Write 0 to Clear**
 - 0 Software Timer 0 will continue to count
 - 1 Software Timer 0 Timeout (set by hardware)
- 0 **Software Timer 0 Count Enable RW**
 - 0 Disable..... default
 - 1 Enable

Offset 81 - Miscellaneous Control (CR1)..... RW

- 7 **Software Generated Suspend Reset**
 - 0 Disable..... default
 - 1 Enable
- 6-5 **Reserved** always reads 0
- 4 **Power Management Unit Support Version 1.0**
 - 0 Disable..... default
 - 1 Enable
- 3 **Reserved** always reads 0
- 2 **Soft-Timer Resolution in Micro-Seconds**
 - 0 default
 - 1
- 1 **PHY Event Interrupt Passed through INTA#**
 - 0 Disable..... default
 - 1 Enable
- 0 **Software Timer 1 Count Enable**
 - 0 Disable..... default
 - 1 Enable

Offset 82 - Power Mgmt Capability Control (PMCC) ... RO

- 7-0 **EEPROM Power Mgmt Capability Shadow**

Offset 83 – Sticky Hardware Control (STICKHW) RW

- 7-4 **Reserved** always reads 0
- 3 **Legacy WOL Status**
 - 0 Disable..... default
 - 1 Enable
- 2 **Legacy WOL Enable**
 - 0 Disable..... default
 - 1 Enable
- 1 **Sticky DS1_Shadow Read-Write by Software**
- 0 **Sticky DS0_Shadow Suspend Well DS Write Port**

Offset 84 – MII Interrupt Status (MISR) RW

- 7 **Power Event Report in Test Mode**
- 6 **User Defined Host Driven Interrupt**
- 5 **User Defined Host Driven Interrupt**
- 4 **Suspend Well MII Polling Status Change Interrupt by Diagnosis Use**
- 3 **Reserved**always reads 0
- 2 **PHY Event Interrupt**
- 1 **Software Timer 1 Interrupt**
- 0 **Software Timer 0 Interrupt**

Offset 86 – MII Interrupt Mask (MIMR)..... RW

- 7 **Power Event Report in Test Mode Mask**
- 6 **User Defined Host Driven Interrupt Mask**
- 5 **User Defined Host Driven Interrupt Mask**
- 4 **Suspend Well MII Polling Status Change Interrupt By Diagnosis Use Mask**
- 3 **TD Internal Error Interrupt Mask**
- 2 **PHY Event Interrupt Mask**
- 1 **Software Timer 1 Interrupt Mask**
- 0 **Software Timer 0 Interrupt Mask**

Offset 8D-8C - Flash Programming Address RW

15-0 Flash ROM Embedded Programming Address

Offset 8F - Flash Embedded Write Data Port..... RW

7-0 Flash ROM Embedded Write Data Port

Offset 90 - Flash Control Status RW

- 7 Flash Embedded Programming Complete**
 - 0 Not Complete default
 - 1 Complete
- 6-2 Reserved** always reads 0
- 1 Flash Embedded Write Command**
 - 0 Normal operation..... default
 - 1 Initiate Write Command
- 0 Flash Embedded Read Command**
 - 0 Normal operation..... default
 - 1 Initiate Read Command

Note: Bit 7 is set after the embedded command is completed. Write operations are not allowed in normal operation.

Offset 91 - Flash Read Data RW

7-0 Flash ROM Embedded Read Data Port

Offset 98 - Flow Control 0 (CR0)..... RW

This register is used for flow control.

7-0 Receive Buffer Count Available for Incoming Packet

Offset 99 - Flow Control 1 (CR1)..... RW

- 7-6 Transmit Pause Frame Low Threshold**
 - 00 4 free Receive Buffer left
 - 01 8 free Receive Buffer left
 - 10 16 free Receive Buffer left
 - 11 24 free Receive Buffer left..... default
- 5-4 Transmit XON Pause Frame High Threshold**
 - 00 24 free Rx Buffer left
 - 01 32 free Receive Buffer left
 - 10 48 free Receive Buffer left..... default
 - 11 64 free Receive Buffer left
- 3 Xon/Xoff Mode in Flow Control**
 - 0 Disable default
 - 1 Enable
- 2 Full Duplex Flow Control on Transmit Side**
 - 0 Disable default
 - 1 Enable
- 1 Full Duplex Flow Control on Receive Side**
 - 0 Disable default
 - 1 Enable
- 0 Half-Duplex Flow Control**
 - 0 Disable default
 - 1 Enable

Offset 9B-9A - Pause Frame Timer RW

15-0 Pause_Timer Value in Outgoing Pause Frame

Offset 9D-9C - Software Timer 0..... RW

15-0 Software Timer with Single Shot

Offset 9F-9E - Software Timer 1 RW

15-0 Software Timer with Periodic Shot

Offset A4 / A0 – Wake On LAN Set / Clear RW

- 7 Wake Up Event Detect Network Status Change from Link On to Link Off**
0 Disable..... default
1 Enable
- 6 Wake Up Event Detect Network Status Change from Link Off to Link On**
0 Disable..... default
1 Enable
- 5 Wake Up Event Detect Magic Packet**
0 Disable..... default
1 Enable
- 4 Wake Up Event Detect Unicast Packet**
0 Disable..... default
1 Enable
- 3 Wake Up Event Detect Pattern 3**
0 Disable..... default
1 Enable
- 2 Wake Up Event Detect Pattern 2**
0 Disable..... default
1 Enable
- 1 Wake Up Event Detect Pattern 1**
0 Disable..... default
1 Enable
- 0 Wake Up Event Detect Pattern 0**
0 Disable..... default
1 Enable

Offset A5 / A1 - Power Configuration Set / Clear (PWCFG SET / PWCFG CLR)..... RW

- 7 PHY Power Down Option default = 0**
- 6 Internal Sticky Logic Control always write 0**
- 5 WOL Pin Signaling Control**
0 Pulse..... default
1 Button
- 4 Legacy Wake On LAN**
- 3 PCI_CFG_PME_SR Shadow**
- 2 PCI_CFG_PME_EN Shadow**
- 1 Legacy WOL_SR Shadow**
- 0 Legacy WOL_EN Shadow**

OffsetA7 / A3 – WOL Configuration Set / Clear..... RW

- 7 Power Management Over PME_OVR**
Forces Power Management Event Enable (PME_EN) for Legacy Use
0 Disable default
1 Enable
- 6 Shadow Full Duplex Control in Suspend Wake On LAN Logic**
0 Disable default
1 Enable
- 5 Shadow Accept Multicast Address Control in Suspend Wake On LAN Logic**
0 Disable default
1 Enable
- 4 Shadow Accept Broadcast Address Control In Suspend Wake On LAN Logic**
0 Disable default
1 Enable
- 3 Reserved (Do Not Program) default = 0**
- 2 Reserved always writes 0**
- 1 Reserved (Do Not Program) default = 0**
- 0 Reserved always writes 0**

Offset AC / A8 – Wake-On-LAN Status 0 RWC

- 7 Wake Up Event Status - Network Status Change from Link On to Link Off**
- 6 Wake Up Event Status - Network Status Change from Link Off to Link On**
- 5 Wake Up Event Status - Magic Packet Filter**
- 4 Wake Up Event Status - Unicast Packet Filter**
- 3 Wake Up Event Status - Pattern 3 Filter**
- 2 Wake Up Event Status - Pattern 2 Filter**
- 1 Wake Up Event Status - Pattern 1 Filter**
- 0 Wake Up Event Status - Pattern 0 Filter**

Offset BF-B0 - WOL Pattern Match CRC Data RW

Offset CF-C0 - WOL Pattern Match Byte Mask 0 RW

Offset DF-D0 - WOL Pattern Match Byte Mask 1 RW

Offset EF-E0 - WOL Pattern Match Byte Mask 2..... RW

Offset FF-F0 - WOL Pattern Match Byte Mask 3 RW

PHY Registers

Offset 0 - MI Control (3100h)..... RW

- 15 PHY Reset** default = 0
(Software Control)
- 14 Loopback Mode**
 - 0 Disable..... default
 - 1 Enable
- 13 Speed Select LSB**
 - 0 10
 - 1 100 **default**
- 12 Auto-Negotiation Process**
 - 0 Disable
 - 1 Enable..... **default**
- 11 Power Down**
 - 0 Disable..... default
 - 1 Enable
- 10 Electrically Isolate PHY from MII**
 - 0 Disable..... default
 - 1 Enable
- 9 Auto-Negotiation Restart**..... default = 0
(Software Control)
- 8 Duplex Mode Select**
 - 0 Half
 - 1 Full **default**
- 7 COL Test**
 - 0 Disable..... default
 - 1 Enable
- 6-0 Reserved** always reads 0

Offset 2 – PHY Identifier 0 (0101h)..... RO

- 15-0 Company ID MSBs**.....always reads 0101h

Offset 3 – PHY Identifier 1 (8F43h)..... RO

- 15-10 Company ID LSBs**.....always reads 8Fh
- 9-4 Manufacturer’s Part number**always reads 43h
- 3-0 Manufacturer’s Revision Number**always reads 0

Offset 1 – Management Information Status (7849h)..... RO

- 15 Capable of 100 Base-T4 Operation**..... default=0
- 14 Capable of 100 Base-TX Full Duplex** default=1
- 13 Capable of 100 Base-TX Half Duplex**..... default=1
- 12 Capable of 10 Base-TX Full Duplex** default=1
- 10-7 Reserved** always reads 0
- 6 Capable of Accepting MI Frames with MI Preamble Suppressed**..... default=1
- 5 Auto-Negotiation Process Completed**..... default=0
- 4 Remote Fault Condition Detected**..... default=0
- 3 Capable of Auto-Negotiation Operation** . default=1
- 2 Link Status** default=0
- 1 Jabber Condition Detected**..... default=0
- 0 Capable of Extended Register**..... default=1

Offset 4 (04h) – AutoNegotiation Advertisement Base Page (05E1h) RW

- 15 Next Page default = 0
- 14 Acknowledge RO, default = 0
- 13 Remote Fault default = 0
- 12-11 Reserved always reads 0
- 10 Flow Control default = 1
- 9 100 Base-T4 Capable default = 0
- 8 100 Base-TX Full Duplex Capable default = 1
- 7 100 Base-TX Half Duplex Capable default = 1
- 6 10 Base-TX Full Duplex Capable default = 1
- 5 10 Base-TX Half Duplex Capable default = 1

FUNCTIONAL DESCRIPTIONS

The VT6105 PCI bus master 10/100 Mbps fast Ethernet controller is a CMOS VLSI chip designed for easy implementation in CSMA / CD IEEE 802.3u 10/100 Mbps Ethernet networks. Significant features include: twisted-pair wiring interface, Plug and Play compatibility, 32-bit bus mastering, powerful buffer management and receive and transmit functions for early interrupt transmit and receive.

The VT6105 integrates the entire bus interface of PCI systems, complying with PCI Specification v2.1 and v2.2. The VT6105 supports the on-chip 100Base-TX layer transceiver.

Host Bus Interface Control Logic

PCI Master Function

The VT6105 supports a descriptor-based communication list between hardware and software on both transmitting and receiving signals. The DMA scheduler fetches the transmit and receive descriptors via PCI bus mastering to check if free buffers are available to store receive packets and scheduled transmission requests.

Data transfer between the system buffers and internal FIFOs in the VT6105 are executed by the internal PCI DMA controller using a bus mastering linear bursting scheme. An advanced internal bus arbitration scheme is implemented to improve bus utilization and service priorities.

The VT6105 also supports a Look Ahead Scheduler which queues multiple transmit frames and back-to-back service receive packets.

When receive or transmit processes are complete, the VT6105 writes back the transfer and network status to the indexed descriptors to release descriptor ownership.

PCI Slave Function

VT6105 supports PCI slave-register I/O and memory-mapped I/O cycles for command and status registers, PCI configuration cycles for Plug & Play BIOS and memory-read cycles for Boot ROM code shadowing.

Buffer Management

The VT6105 hardware controller and drivers communicate through two data structures:

1. Control and status register (CSR)
2. Descriptor entries and data buffers

During initialization, the drivers create the structure of the Transmit and Receive descriptors in physical memory and decide the base address for the Receive and Transmit descriptor rings, which are written to registers CSR6 (Current Receive Descriptor Address) and CSR7 (Current Transmit Descriptor Address) respectively. The number of entries contained in the descriptor rings and the buffers reserved in physical memory for Receive and Transmit descriptors are set up during initialization.

Each of the descriptor entries must occupy a contiguous area of memory. The Receive (Transmit) Descriptor DMA register of the CSR also keeps the content of the current and next Receive and Transmit Descriptor.

Simple Ring Buffer Structure

Figure 3. Buffer Structure

For Reception, when the data packets in the receive FIFO are transferred to system memory, the controller will proceed to write back the current packet reception status to the receive descriptor and then update the transmit interrupt status in the ISR.

When transmitting data, the controller starts the DMA cycle and brings the data from memory to the Tx FIFO register and updates the status information of the Transmission Descriptor DMA Register after transmission is complete. The controller then proceeds to write back to the descriptor in memory using another DMA cycle.

Receive Descriptor Packet Layout (RD)

The Receive Descriptor packet layout provides a data buffer address, byte-count, and a next descriptor address. The chain bit allows data storage to span multiple data buffers and is compatible with various types of memory-management schemes.

	31	30-16	0-15
RDES0	0	Rx Length Field	RSR
RDES1	Reserved		Rx_Buffer_Size
RDES2	Rx_Buffer_Start_Address		00
RDES3	Next_Rx_Desc_Address		

Figure 4. Receive Descriptor Packet Layout

The Receive Descriptor Layout consists of four levels of data: RDES0, RDES1, RDES2, and RDES3.

Table 4. Receive Descriptor 0 (RDES0)

Bit	Symbol	Description
31	OWN	Owner. This bit is controlled by the driver, which enables the bit when initialized. 1 indicates that a descriptor is free for the VT6105 to use. 0 means this descriptor is being used by the VT6105.
16-30	Rx_Length_Field	Receive Length
15-8	Receive Status Register	
15	RXOK	No Receive Errors
14		-reserved-
13	MAR	Accept Multicast Address Packets

Table 9. Transmit Descriptor 1 (TDES1)

Bit	Symbol	Description
31-24	TCR	Transmit Control Register.
23-16	Tx_Control_Fie ld	Transmit Control Field
23	IC	Interrupt Control 0: No interrupt when Transmit OK 1: Interrupt when Transmit OK
22	STP	Packet Start , in Descriptor ring structure STP=1 EDP=1 - single buffer per packet STP=1 EDP=0 - packet segment STP=0 EDP=1 - packet end indication STP=0 EDP=0 - invalid setting
21	EDP	Packet End Indication
20-17	-reserved-	-reserved- (must always be "0")
16	CRC	Disable CRC Generation
15	CHN	Chain Structure 1 Indicates a chain structure 0 indicates a ring structure.
14-11	Tx_Buffer_Size	Transmit Buffer Size Always reads 0
10-0	Tx_Buffer_Size	Transmit Buffer Size Always reads 0

Table 10. Transmit Descriptor 2 (TDES2)

Bit	Symbol	Description
31-0	Tx_Buffer_ start_address [31:0]	Transmit Buffer Start Address Byte-oriented transmit data buffer starting address

Table 11. Transmit Descriptor 3 (TDES3)

Bit	Symbol	Description
31-2	Next_Tx_ Desc_Address [31:2]	Next Transmit Descriptor Address Next linked transmit descriptor start address

FIFO and Control Logic

The VT6105 incorporates two independent deep memory FIFOs for data that is transmitted and received between the system interface and the network interface. The FIFOs provide temporary data storage and frees the host system from the real-time demands of the network.

The VT6105 implements enhanced receive FIFO management logic to handle multiple received data packets that are transferred to the system data buffer. This ability can reduce packet loss due to PCI bus mastering arbitration latency. The PCI bus mastering arbitration latency is the time from a request issued by the master to when the receiver (arbiter) performs the request.

Network Interface

The VT6105 controller supports 100Base-TX and 100Base-FX transceivers, and provides an independent 10 / 100 BaseT transceiver interface to an external 1:1 magnetic transceiver.

100BaseT Transceiver Auto MDI/MDIX Configuration Function

The VT6105 supports MDI / MDIX functions for user-friendly installation of switch hubs, peer-to-peer PCs, cable modems, and ADSL modems with crossover TP usage.

LED Status and PHY Force Fiber Mode Strapping

VT6105 network status information is available on four LED output pins. The LEDs reflect network status per the "LED Select" bits in PHY register Rx10[6:5] and can be set up to indicate various status functions such as the transmit, receive and collision activities, link status, and link polarity. LED Function Definition is summarized in Table 12 below.

Table 12. LED Status

LEDSEL	LED0 (Blanking)	LED1	LED2	LED3
00	Link / Active	Speed	Duplex	COL
01	Power / TxAct	Link / RxAct	Speed	Duplex
10	Spd100	Spd10	Active	Duplex
11	Power / TxAct	Link / RxAct	Speed	COL

Table 13. Strapping Pins

Symbol	Description
LED0	0: PHY Test Mode 1: Normal (external pullup default)
LED3	0: Force Mode 1: NWAY Enable (external pullup default)
FXSD_ FXENP	Both 0 and TP Mode (default), Set to Fiber configuration FiberMode (See App Note)

EEPROM Interface

EEPROM Direct Programming

The VT6105 features an easy way to program the external serial EEPROM directly. Setting EELOAD (Rx78[7]) and DPM (Rx74[4]) make the VT6105 enter Direct Programming Mode. In this mode the user can directly control the EEPROM interface signals by writing to the EECSR register (Rx74). EECS (bit 3), EESK (bit 2), and EEDI (bit 1) will be driven onto the EECS, EESK, and EEDI pins respectively. These outputs will be latched so the user can generate the EEPROM interface signals per the 93C46 data sheet.

To read EEPROM data, the EEPROM interface must generate signals onto the EECS, EESK, and EEDI pins at the same time as data is read from the EEDO input via the EEDO bit (bit 0). Reading the EEDO bit during programming will not affect the latched data on the EECS, EESK, and EEDI outputs. When the EEPROM has been programmed and verified (including the lower byte of 0Fh with 73h), the VT6105 must be reset to return to normal operation and read in the new data.

Direct Programming Mode is mainly used for production to program every bit of the EEPROM. Once the lower byte of 0Fh has been programmed with 73h and a power-on reset has been performed, EEPR (Rx74[7]) will be set so the contents of the EEPROM may not be changed.

EEPROM Embedded Programming

If the upper byte of 0Fh of the serial EEPROM has been programmed to 73h when the VT6105 is loading the EEPROM data during power-on reset, the EEPR bit of Signature Register will be set to prohibit Direct Programming mode. However, configuration registers A, B, and C are programmed using Embedded Programming mode by following the routine specified in the example code below. This operation will work regardless of the value of EECONFIG. The setting of the EELOAD bit of Configuration Register B starts the EEPROM write process. Care should be taken not to accidentally modify the “polarity” (POL) and “good link” (GDLNK) bits because these two bits return the value indifferent from the setting. This programming process is ended when the EELOAD bit goes to zero.

```
EEPROM_EMB_PROG ( )
{
    // defined constant:
    CONFIG_B, EELOAD
    // declared register: value,
    config_for_A, config_for_B,
    config_for_C
    // declared function:
    DISABLE_INTERRUPTS,
    ENABLE_INTERRUPTS, READ, WRITE, WAIT
    DISABLE_INTERRUPTS ( );
    value = READ (CONFIG_B);
    value = value | EELOAD;
    WRITE (CONFIG_B, value);
    READ (CONFIG_B);
    WRITE (CONFIG_B,
config_for_A);
    WRITE (CONFIG_B,
config_for_B);
    WRITE (CONFIG_B,
config_for_C);
    while (value || EELOAD)
    {
        value = READ (CONFIG_B);
        WAIT ( );
    }
    ENABLE_INTERRUPTS ( );
}
```

EEPROM Contents

The VT6105 supports a 93C46 external Serial ROM, which may be used, when a BootROM is not used, to store the Ethernet ID, sub-vendor ID, and chip configurations (listed in Table 14 below):

Table 14. Chip Configuration EEPROM Contents

Offset ID	Chip Configuration	
	Bit [15:8]	Bit [7:0]
00h	Ethernet Global ID [15:8]	Ethernet Global ID [7:0]
01h	Ethernet Global ID [31:24]	Ethernet Global ID [23:16]
02h	Ethernet Global ID [47:40]	Ethernet Global ID [39:32]
03h	Reserved (always 00h)	Reserved (always 00h)
04h	PCI Configuration Sub-System ID [15:0]	PCI Configuration Sub-System ID [7:0]
05h	PCI Configuration Sub-Vendor ID [15:0]	PCI Configuration Sub-Vendor ID [15:0]
06h	Reserved (always 00h)	Reserved (always 00h)
07h	Reserved (always 00h)	Reserved (always 00h)
08h	Reserved (always 00h)	PCI Power Management Capability Setting
09h	Reserved (always 00h)	Reserved (always 00h)
0Ah	Reserved (always 00h)	Reserved (always 00h)
0Bh	PCI Configuration Maximum Latency Setting	PCI Configuration Minimum Grant
0Ch	Bus Control Register 1	Bus Control Register 0
0Dh	Chip Configuration B	Chip Configuration A
0Eh	Chip Configuration D	Chip Configuration C
0Fh	Checksum	73 h

The “Power Management Capability Setting” byte includes the following:

- Bit-0: D0_En - D0 state capable
- Bit-1: D1_En - D1 state capable
- Bit-2: D2_En - D2 state capable
- Bit-3: D3h_En - D3 hot state capable
- Bit-4: D3c_En - D3 Aux power state capable
- Bit-5: D1_Dis - Disable D1 state support
- Bit-6: D2_Dis - Disable D2 state support
- Bit-7: DSI - DSI in PMU register

Interrupt Control

Data consists of an entire frame or part of a frame that is within the size of a single Ethernet frame. Buffers contain only data; all buffer status is maintained in the descriptor. Data chaining is enabled or disabled by the Chain bit in DES1[15]. Interrupt control may also be enabled or disabled by DES1[23].

Interrupt generation control for packet transmission and reception are defined in transmit and receive descriptors.

When the Interrupt Control bit (DES1[23]) is set to 1, the receive or transmit interrupt is generated regardless of whether the completed frame has been transmitted or received. This feature enables the Operating System to pre-fetch the frame header or save the interrupt service overload.

Figure 6. Interrupt Control

Flow Control

The VT6105 is Jam based in half-duplex and supports the IEEE 802.3x flow control scheme while in full duplex. This occurs when the VT6105 detects the receive buffers or when the external FIFO is running up.

In half duplex mode, the MAC sends jam patterns automatically when the addressed packets are stopping transmission from the source station. In full duplex mode, the VT6105 will generate a Pause control frame to inform the source station to stop transmission for a specified period of time defined in the Pause frame. After the busy condition is clear, the VT6105 will send another Pause control frame with pause_time (0000h) to inform the source station to prepare packet reception.

The VT6105 also implements detection logic to filter incoming pause control frames. When a valid Pause control frame is detected, the VT6105 enters the Backoff state after the current transmission is completed and waits for the specified period of time defined in the received Pause frame to operate. The VT6105 will retransmit other packets in the transmit queue after receiving a new pause frame with pause_time (-0000h) or when the pause timer has expired.

Also, IEEE 802.3x flow control capability results from N-Way auto-negotiation and can be optionally disabled.

Power Management

The VT6105 is compliant with ACPI V1.0, PCI Power Management V1.1 and Network device class power management V1.0a specifications. It meets the PC97/PC98/PC99/PC2001 and net PC requirements. VT6105 can wake up a system in power-down mode. Using four wake-up events, VT6105 wakes up a system via the PME# and restores the system to its running state.

Wake-up Events

- **Link Status Change:** If the link state is either connect or disconnect, PME# is generated when the link state changes
- **Magic Packet:** When the VT6105 is set to magic packet mode, it requires that a received packet qualify as a Magic Packet
- **Magic Packet Pattern:** The Magic packet pattern (six FFh bytes + 16 times Source Address duplication) matches the destination address of the received magic packets. The Magic register (RxA0[5]) is set to enabled and the VT6105 will receive the packet.
- **Unicast Physical Address Match:** When the VT6105 is set to Unicast mode, it requires a received packet to qualify as a unique individual address. The Unicast register bit (RxA0[5]) is set to enabled and the VT6105 will receive the packet.
- **MS-Defined Pattern Match:** When the stations shut down after an operating system is loaded, the IP address, station name or other defined values are set by the drivers to VT6105
 - IP (ARP)
 - Name Query
 - NET BIOS
 - VIA defined

Table 15. Power States

VT6105 Device State	Conditions	I _{PCI} mA	I _{AUX} mA	Action from Function
D0	PCI = 33MHz, MAC = 25MHz, Tx, Rx Active	28	11	Full function
D1, D2	PCI = 33MHz, MAC = 25MHz, PCI bus transaction Idle	18	9	Wake up event detection
D3 hot	PCI Clock Idle, MAC = 25MHz, Tx off, Rx on	9	8	Wake up event detection
D3 cold	PCI power off, MAC = 25MHz, Tx off, Rx on	9	8	Wake up event detection

Figure 12. Configuration Read / Write

Flash Read Timing

Figure 16. Flash Read Timing

Symbol	Parameter	Min	Typ	Max	Unit
T _{AS}	Address Setup Time		85		ns
T _{AA}	Address Cycle Time		508		ns
T _{RP}	BPWR# Pulse Width		330		ns
T _{RD}	Read Access Time			230	ns
T _{DH}	Data Hold Time			0	ns

LED Identification

LED ON/OFF ($0 < T_{pd} < 300$)

Figure 17. LED On / Off ($0 < T_{pd} < 300$)

Symbol	Parameter	Min	Typ	Max	Unit
T ₁	LED[3:0] On Time		68		ms
T ₂	LED[3:0] Off Time		68		ms

TP Interface

10BaseT Normal Link Pulse Timing ($0 < T_{pd} < 300$)

Figure 18. 10Base-T Normal Link Pulse Timing ($0 < T_{pd} < 300$)

Symbol	Parameter	Min	Typ	Max	Unit
T ₁	NLP Pulse Width		100		ns
T ₂	NLP TO NLP Period		12		ns

Auto Negotiation Fast Link Pulse Timing ($0 < T_{pd} < 300$)

Figure 19. Auto Negotiation Fast Link Pulse Timing ($0 < T_{pd} < 300$)

Symbol	Parameter	Min	Typ	Max	Unit
T ₁	Clock, Data Pulse Width		100		ns
T ₂	Clock Pulse to Clock Pulse Period		125		μs
T ₃	Clock Pulse to Data Pulse Period		62.5		μs
T ₄	Burst Width		4.2		ns
T ₅	FLP Burst to FLP Burst Period		8.5		ns

Running State Software Driven Internal PHY Reset Timing:

Figure 20. Running State Software Driven Internal PHY Reset Timing

Item	Description	Min	Max	Unit
A	Clock, Data Pulse Width	10		us
B	VT6105 PHY can begin to accept MDIO cycle after software initiated PHY Reset is de-asserted.	30		cyc
		1		uS

MECHANICAL SPECIFICATIONS

Part Number

- Y = Date Code Year
- W = Date Code Week
- V = Chip Version
- R = Revision Code
- L = Lot Code

CONTROL DIMENSIONS ARE IN MILLIMETERS.

NOTES :

1. DIMENSIONS D1 AND E1 DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25 mm PER SIDE. D1 AND E1 ARE MAXIMUM PLASTIC BODY SIZE DIMENSIONS INCLUDING MOLD MISMATCH.
2. DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED THE MAXIMUM b DIMENSION BY MORE THAN 0.08mm. DAMBAR CAN NOT BE LOCATED ON THE LOWER RADIUS OR THE FOOT. MINIMUM SPACE BETWEEN PROTRUSION AND AN ADJACENT LEAD IS 0.07mm.
