

# MCS 386SX/16V - INTRODUCTION

The MCS 386SX/16V is a high performance 386SX processor based system. It features a 386SX processor, 1MB of on-board cache, a 386SX compatible CPU and 16-bit hardware floating point unit. The system is designed to be used with system and component to a 16-bit architecture.

# MCS 386SX/16V SYSTEM BOARD

First Edition April 1990

For further information on MCS 386SX/16V system board, please contact your local distributor. A detailed manual is available for the MCS 386SX/16V system board. This manual is available in the form of a hard copy or on floppy disk. The manual is available in the form of a hard copy or on floppy disk. The manual is available in the form of a hard copy or on floppy disk.

Quality and compatibility is achieved through the use of a customised BIOS from AWARD Software. The BIOS supports all the special features of the board and provides the necessary BIOS services to emulate an IBM PC/AT. A convenient setup utility is built into the BIOS ROM to facilitate the hardware based setup program.

Typical applications for a system configured with the MCS 386SX/16V motherboard are:

## MCS 386SX/16V - INTRODUCTION

The MCS 386SX/16V personal computer system board is a high performance and low cost AT-compatible system board based on the Intel 80386SX microprocessor. It features a 32-bit software architecture which includes a 32-bit fully 80386 compatible CPU and 16-bit hardware architecture with 16-bit data and 24-bit address buses. These characteristics provide the performance benefit of 32-bit software architecture with system cost comparable to a 12 MHz 16-Bit 80286 personal computer system board.

On this i386SX based product, a custom Page mode memory controller is employed to optimise the performance of the CPU. This main memory controller allows the system to run at maximum speed while at the same time using low cost and widely available 80 ns DRAMs. System ROM BIOS and Video BIOS are also shadowed by the fast main memory allowing BIOS routines to execute at a much faster rate. Up to 7 MB of 32-Bit main memory can be directly installed onto the MCS 386SX/16V system board without taking up any of the expansion slots.

For hardware expansion, 6 16-bit PC/AT slots and 2 PC/XT slots are provided on the MCS 386SX/16V system board. All the expansion slots operating at 8 MHz bus speed are designed to maintain the de-facto IBM PC/AT bus standard even though the CPU itself runs at the maximum clock rate of 16 MHz. This ensures the user the access to the billions of dollars worth of established industry standard products currently available.

Software compatibility is achieved through the use of a customized BIOS from AWARD Software. The BIOS supports all the special features of the board and provides the necessary BIOS services to emulate an IBM PC/AT. In addition, a convenient soft-setup utility is built into the BIOS ROMs to eliminate the need for a diskette based setup program.

Typical applications for a system configured around a MCS 386SX/16V motherboard include :

- \* For business or accounting applications
- \* For DOS, OS/2 or UNIX software development
- \* For cost effective CPU intensive applications like Computer-Aided Design, desktop publishing and database management systems.
- \* As a network terminal or file server

## MAIN FEATURES OF THE MCS 386SX/16V

The following highlight the main features of the MCS 386SX/16V system board:

- \* 32-bit Intel 80386SX microprocessor running at 16 MHz
- \* Socket for 80387SX Coprocessor
- \* Page mode main memory (DRAM) controller  
Page-hit memory cycles : 0 wait states  
Page-miss memory cycles : 2 wait states
- \* 1/2/3/4/5/6/7 MB of main memory on-board using DRAMs with access time of 80 ns.
- \* Supports various type of DRAM for lowest cost minimum system configurations:
  - 8 pcs of 44256 and 4 pcs 41256 (1 MBytes)
  - 18 pcs of 411000 (2 MBytes)
  - 4 pcs of 256k by 9 SIMM module (1 MBytes)
  - 2 pcs of 1Meg by 9 SIMM module (2 MBytes)
- \* Shadow ROM and Video BIOS
- \* On-board system support peripherals:
  - 7 DMA channels
  - 15 levels of interrupts
  - 6 programmable timer/counters
- \* Dallas real time clock to ensure clock accuracy
- \* 8 Expansion Slots comprising 6 16-bit and 2 8-bit slots  
Fully 8 MHz IBM PC/AT bus compatibility
- \* Customized ROM BIOS with built-in SETUP from AWARD Software
- \* High quality 4-layer Printed Circuit Board
- \* Standard BABY-AT form factor and mounting holes

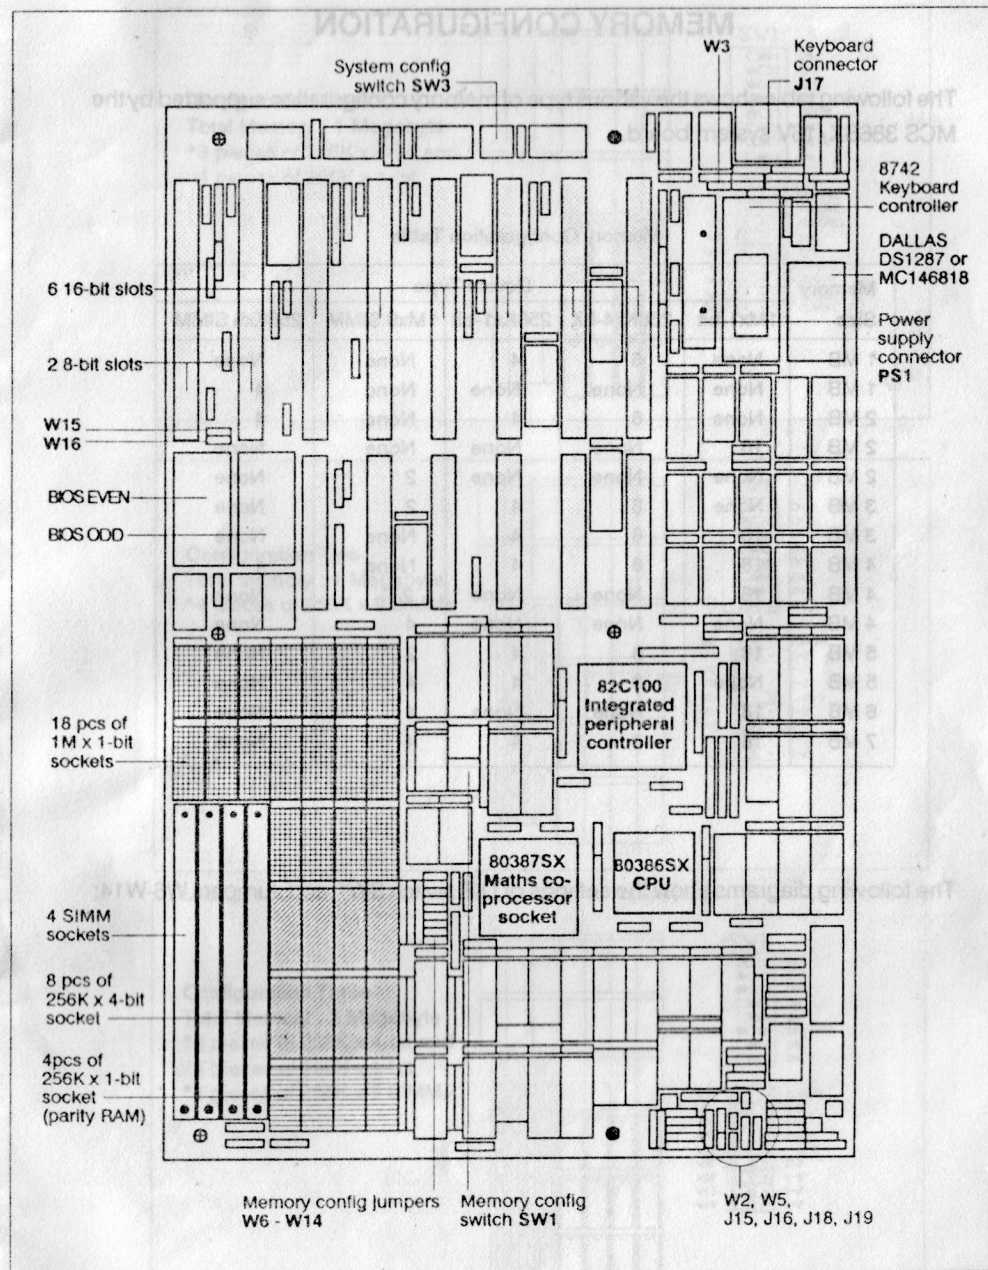

System Board DIP Switch SW3 Settings

SW No	Function	Configuration	Position
1	Soft-Turbo	Enabled Disabled	ON* OFF
2	80387SX	Installed Not Installed	ON* OFF
3	Display Type	CGA/EGA/VGA Monochrome	ON* OFF
4	OS/2 Optimisation	Enabled Disabled	ON* OFF

DIP Switch Block SW3

**Default:**  
Setspeed enabled  
80387SX installed  
CGA/EGA/VGA adaptor  
OS/2 optimisation enabled

MCS 386SX/16V System Board Layout

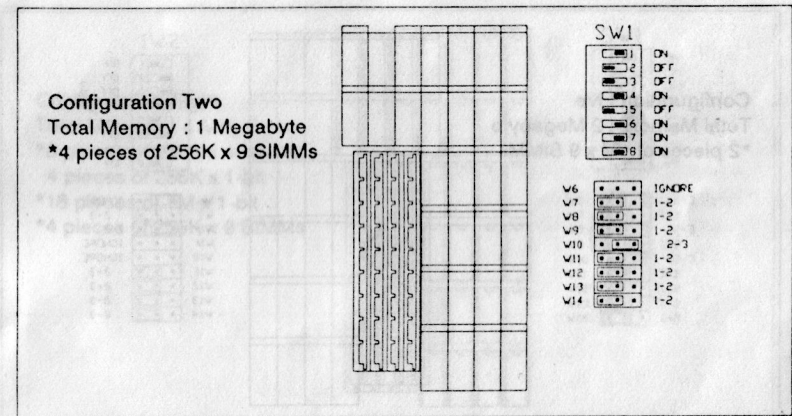

## MEMORY CONFIGURATION

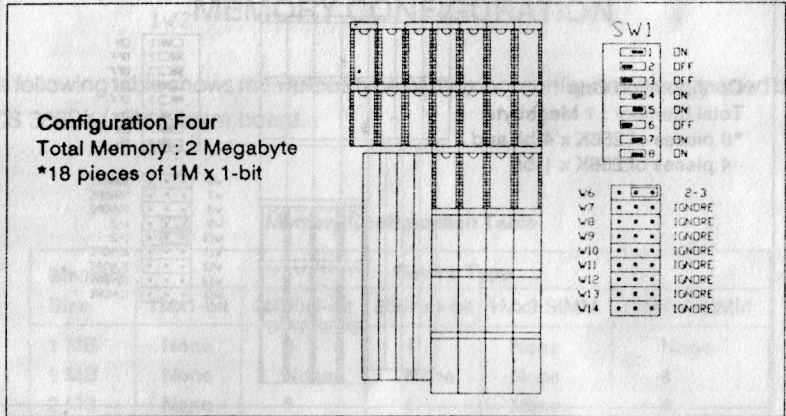

The following table shows the various type of memory configuration supported by the MCS 386SX/16V system board.

Memory Configuration Table

Memory Size	Device Type				
	1Mx1-bit	256Kx4-bit	256Kx1-bit	1Mx9 SIMM	256Kx9 SIMM
1 MB	None	8	4	None	None
1 MB	None	None	None	None	4
2 MB	None	8	4	None	4
2 MB	18	None	None	None	None
2 MB	None	None	None	2	None
3 MB	None	8	4	2	None
3 MB	18	8	4	None	None
4 MB	18	8	4	None	4
4 MB	18	None	None	2	None
4 MB	None	None	None	4	None
5 MB	18	8	4	2	None
5 MB	None	8	4	4	None
6 MB	18	None	None	4	None
7 MB	18	8	4	4	None

The following diagrams show the settings of DIP switch SW1 and Jumpers W6-W14:

**Note :** As the MCS 386SX/16V system board is shipped with a customised version of the Award BIOS i.e. using 384Kb for shadow BIOS, switch 8 of DIP switch block SW1 must always be set to 'ON'.

If other type of BIOS is used, switch 8 must be set to 'OFF'.

## Power Supply Connector - PS 1

PS 1 is a 12-pin connector which connects to the power supply's P8 and P9 connectors. The power supply's P8 connector is connected to pins 1 through 6 and the P9 connector is connected to pins 7 to 12.

The pins assignment of this 12-pin connector is defined as follows:

Pin Number	Function
1	Power Good
2	+ 5V
3	+ 12V
4	- 12V
5	Ground
6	Ground
7	Ground
8	Ground
9	- 5V
10	+ 5V
11	+ 5V
12	+ 5V

## THE SETUP PROCEDURE

### What SETUP does?

The CMOS RAM of the clock calendar contains configuration information pertaining to the systems date/time and equipment configuration. This information is entered via a SETUP program which is built into the MCS 386SX/16V ROM BIOS and is maintained by the battery even when the power is turned off. The ROM BIOS contains essential system initialization and self-test code, programming interfaces and the bootstrap program in addition to the SETUP program. It is executed everytime the system is powered-on.

The SETUP program in the ROM BIOS records the following information:

- 1) Date and Time
- 2) Number, type and capacity of floppy diskette drive
- 3) Number, type and capacity of fixed disk drive
- 4) Amount of memory installed
- 5) Amount of expansion memory installed
- 6) Primary display adaptor type

You should run the SETUP program everytime you add, remove or change the system's configuration. If you are using external batteries, you should also run the SETUP program everytime you replace these batteries.

### Activating the SETUP Program

The MCS 386SX/16V BIOS contains a built-in SETUP program and does not require any diskette based SETUP program. To activate the SETUP program, enter the following keystroke sequence i.e. <Ctrl>-<Alt>-<Esc> after a hardware reset by either depressing the "POWER" or "Reset" button.

Alternatively, a difference between the systems configuration and the information stored in the BIOS will prompt a request by the computer to enter the <Ctrl>-<Alt>-<Esc> keystroke sequence. The following diagram shows what the SETUP screen looks like.

## CONNECTOR PORTS

The following sub-sections highlight the various connector ports available on the MCS 386SX/16V system board. It also describes the pin assignment of these connectors. For your convenience, a diagram showing the header pinouts of these connectors is also included (See Figure 2.4).

### Keyboard Connector - J17

The 5-pin DIN-socket, J17, accepts any standard AT-compatible keyboard such as an 101-keys keyboard. The connector is located at the rear right-hand side of the MCS 386SX/16V system board. The pins assignment are defined as follows:

Pin Number	Function
1	Keyboard Clock
2	Keyboard Data
3	Spare
4	Ground
5	+5V (VCC)

### External Battery Connector - J15

To provide the CMOS backup function, a DALLAS DS1287 real time clock is installed on the MCS 386SX/16V system board. Battery connector, J15 is also provided in case external batteries are required.

The following table shows the polarity of the battery connector J15. If an external battery pack is used, the battery's positive and negative terminal will be connected to pin #1 and pin #4, respectively.

Pin Number	Function
1	+ 4.5V DC from Battery
2	Not Used
3	Ground
4	Ground

### Speaker Connector - J19

J19 (located at the front) is a 4-pin Berg-strip which is used to connect to a 2-inch, 8-ohm speaker. The pins assignment of this connector is defined as follows:

Pin Number	Function
1	Speaker Data Output
2	Key
3	Ground
4	+ 5V (VCC)

### Push Button Reset Connector - J16

The reset connector, J16, is used to connect to the reset button. This connector provide a full system reset much like turning off the power and then on again. The pins assignment is shown below:

Pin Number	Function
1	- Reset
2	Ground

### Power Indicator & Keylock Connector - J18

J18 is a 5-pin header which provides connection to a front panel power-on indicator LED and security lock. The pins assignment for this connector is as follows:

Pin Number	Function
1	LED Anode (Positive)
2	Key
3	Ground
4	Keylock
5	Ground

The SETUP Screen

SETUP Selections

The following sections discusses how to respond to the SETUP prompts.

1) **Entering the Current Date**

Enter the current date into this field and press <Enter>. Enter the date in the following format: MONTH/DAY/YEAR. For example, to enter the date May 6th, 1989, you would type "5/6/89". The "/" must be entered as a separators. The <Backspace> key can be used to correct typing mistakes.

2) **Entering the Current Time**

Type the current time into this field and press <Enter>. Enter the time in the format HOUR:MINUTE:SECONDS. It is not necessary to enter leading zeros in front of numbers or to enter values for the seconds. However you will need to enter ":" to separate the hour from the minute.

3) **Diskette 1**

Diskette 1 refers to the floppy disk drive that you would like to setup as "A" drive. Four types of diskette drive are supported.

- a) 1.2MB (5.25 inch AT-Type high-density drive)
- b) 360KB (5.25 inch PC-Type standard drive)
- c) 720KB (3.5 inch single-sided drive)
- d) 1.44MB (3.5 inch double-sided drive)

Selection can be made when the DISKETTE 1 field is highlighted. Use the <Left> or <Right> arrow key to select the type of diskette drive installed.

4) **Diskette 2**

Diskette 2 refers to the floppy disk drive you would like to setup as "B" drive. If you have only one diskette drive, select NONE for this field. Otherwise, follow the procedure outlined previously.

5) **Disk 1**

Selection DISK 1 identifies the Type Number of the first fixed disk drive that has been installed in the system. The system need this information in order to make full use of the available storage capacity in the fixed disk.

Press the <Right Arrow> key to select a higher numbered fixed disk or <Left Arrow> key to select a lower numbered one. Alternatively, simply type in the fixed disk type number followed by <Enter>.

6) **Disk 2**

You can use this field to install a second fixed disk in your system. If you have only one fixed disk installed in your system, select NONE for this field, otherwise follow the procedure outlined in the previous section.

7) **Selecting the type of Video Adapter Installed**

This selection specifies the type of Video adapter installed. The following selections are available:

- a) MONO (Monochrome adapter)
- b) COLOR 40 (Colour Graphics Adapter, power-up in 40-column mode)
- c) COLOR 80 (Colour Graphics Adapter, power-up in 80-column mode)
- d) EGA/VGA (Enhanced or Video Graphics Adapter)

8) **Base Memory**

Base Memory is the memory usable by DOS, the primary operating system for the MCS 386SX/16V. It is the memory that is addressed from zero to the 1MB boundary. On the MCS 386SX/16V, Base Memory is fixed at 640KB.

9) **Extended Memory**

Extended Memory is the memory beyond the 1MB boundary. It is normally not accessible by DOS except as RAM disks. Protected Mode operating systems such as Unix, OS/2 and Xenix can take advantage of Extended Memory.

As the MCS 386SX/16V comes standard with 1 MB of RAM, 384 KB of Extended Memory will be available if the "Shadow RAM" feature is disabled. If "Shadowing" feature is enabled then the amount of extended memory available is 256 KB.

10) **Error Halt Options**

The system will normally enter a Halt condition when it encounters any error condition during its power-on-self-test (POST). You can override this using the ERROR HALT field. The following are valid selections:

a) **HALT ON ALL ERRORS**

Default selection, stop when any error is encountered.

b) **NO HALT ON ANY ERRORS**

Continue even if errors are encountered.

c) **NO KEYBOARD ERROR HALT**

Continue even if keyboard is bad or not installed. Halt on any other errors.

d) **NO DISK ERROR HALT**

Continue even if no disk is installed. Halt on any other errors.

e) **NO KEYBOARD OR DISK ERROR**

Continue even if both keyboard and disk error are present. Halt on any other errors.

11) **Shadow RAM**

"Shadowing" is a technique in which the BIOS and/or VIDEO programs stored in slow EPROM are transferred to faster system RAM memory. This can appreciably speed up programs which make intensive use of the BIOS and VIDEO facilities. Three options are available for this selection:

a) **DISABLE** (does not enable shadowing option)

b) **BIOS** (enables BIOS shadowing only)

c) **BIOS & VIDEO** (enables both BIOS & VIDEO BIOS ROM shadowing)

On powering-up, the BIOS checks for the presence of either an EGA or VGA display adapter. If neither is found or, if you have a monochrome display adapter installed, you will not be able to shadow the VIDEO BIOS. In this instance, option (c) will achieve the same result as option (b).

**Saving the Configuration**

After you have entered all the correct settings, press the <F10> function key to record the new values in the system's battery-backed memory. Press the <F5> function key to confirm. The system will then reboot itself with the new configuration setting. This concludes the SETUP procedure.

## MCS 386SX/16V HARD DISK TYPE TABLE
