SUPER® P8SC8
SUPER® P8SCi

USER'S MANUAL

Revision 1.0c

Revision Number: Rev. 1.0c

Release Date: June 8, 2007

Preface

About This Manual

This manual is written for system integrators, PC technicians and knowledgeable PC users. It provides information for the installation and use of the SUPER● P8SC8/P8SCi motherboard. The P8SC8/P8SCi supports single Intel Pentium® 4 Processor (the Prescott Processor) in the 775-Land Grid Array Package (LGA 775) at a system bus speed of 800 MHz. The Pentium 4 Processor in the 775-Land Grid Array Package is housed in a Flip-Chip Land Grid Array (FC-LGA4) package that interfaces with the motherboard via an LGA775 socket. The package consists of a processor core mounted on a substrate land-carrier. An integrated heat spreader (IHS) is attached to the package substrate and core and serves as the contacting surface for processor component thermal solutions, such as a heatsink. Please refer to the motherboard specifications pages on our web site (http://www.supermicro.com/Product_page/product-m.htm) for updates on supported processors. This product is intended to be professionally installed.

Manual Organization

Chapter 1 includes a checklist of what should be included in your mainboard box, describes the features, specifications and performance of the P8SC8/P8SCi mainboard and provides detailed information about the chipset.

Chapter 2 begins with instructions on handling static-sensitive devices. Read this chapter when installing the processor and DDR2 memory modules and when mounting the mainboard in the chassis. Also refer to this chapter to connect the floppy and hard disk drives, the IDE interfaces, the parallel and serial ports, the mouse and keyboard and the twisted wires for the power supply, the reset button, the keylock/power LED and the speaker.

If you encounter any problems, see **Chapter 3**, which describes troubleshooting procedures for the video, the memory and the setup configuration stored in CMOS. For quick reference, a general FAQ (Frequently Asked Questions) section is provided. Instructions are also included for contacting technical support. In addition, you can visit our web site at www.supermicro.com/techsupport.htm for more detailed information.

Chapter 4 includes an introduction to BIOS and provides detailed information on running the CMOS Setup utility.

Appendix A provides BIOS POST Messages.

Appendix B lists BIOS POST Codes.

Appendix C lists Software Drivers and the OS Installation Instructions.

Introduction

1-1   Overview

Checklist

Congratulations on purchasing your computer motherboard from an ac-knowledged leader in the industry. Supermicro boards are designed with the utmost attention to detail to provide you with the highest standards in quality and performance.

Please check that the following items have all been included with your motherboard. If anything listed here is damaged or missing, contact your retailer.

All Included with Retail Box Only

One (1) Supermicro Mainboard

One (1) IDE cable

One (1) 9-pin Serial port DKT Cable

One (1) ATX floppy drive cable w/3 heads

Two (2) SATA cables

One (1) U320 SCSI Cable (*P8SC8 only)

One (1) I/O shield

One (1) Supermicro CD containing drivers and utilities

One (1) User's/BIOS Manual

One (1) U320 SCSI User's Manual (*P8SC8 only)

Contacting Supermicro

Figure 1-1. SUPER● P8SC8 Image
(*Note: SCSI support is available for the P8SC8 motherboard only.)

Figure 1-3. Motherboard Layout
(not drawn to scale)
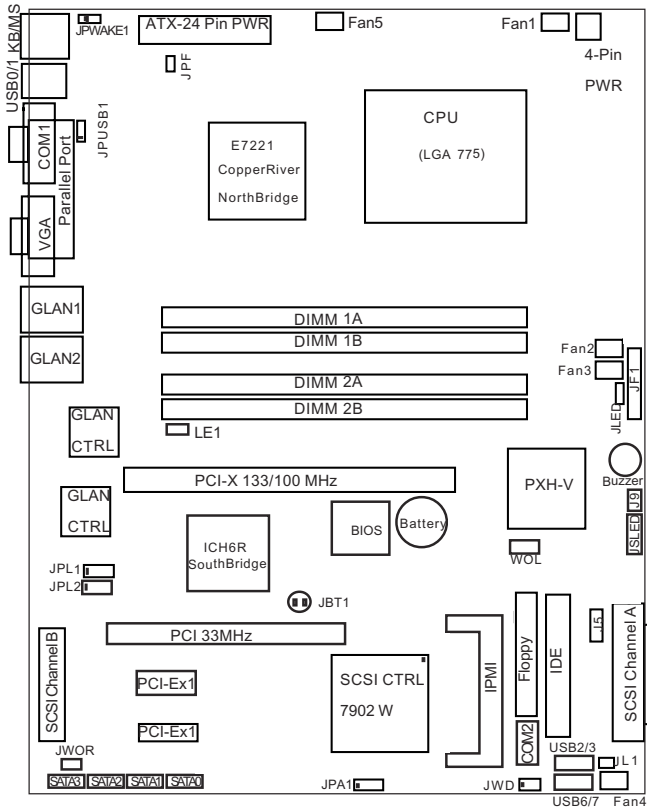

Notes

1. See Chapter 2 for detailed information on jumpers, I/O ports and JF1 front panel connections.

2. "▪" indicates Pin 1.

3. The only differences between the P8SC8 and the P8SCi are:

a. P8SC8 has SCSI and it supports PCI-X 100 MHz,

b. P8SCi does not have SCSI and it supports PCI-X up to 133MHz.)

4. The pictures and drawings shown in this manual were based upon the latest PCB revision available at the time of publishing of this manual. The motherboard you've received may or may not look exactly the same as the graphics shown in the manual.

P8SC8/P8SCi Quick Reference

Jumpers	Description	Default Setting
JBT1	CMOS Clear	See Section 2-7
JPA1 (*P8SC8)	SCSI CTRL Enable	Pins 1-2 (Enabled)
JPF	Power Force-On	Open (Normal)
JPL1/JPL2	LAN1/LAN2 Enable	Pins 1-2 (Enabled)
JPUSB1	USB Wake Up (USB1/2)	Pins 2-3 (Disabled)
JPWAKE1	KB/Mouse Wake-Up	Pins 2-3 (Disabled)
JWD	Watch Dog	Pins 1-2 (Reset)

Connectors	Description
ATX Power	24-Pin Power Connector
4-Pin Power	4-Pin Power Connector
COM1, COM2	COM Port/Serial Port 1 & Port 2 Connectors
Fans 1-5	Fan1: CPU Fan, Fan2-5: Chassis Fan Headers
DIMM#1A,#2A,#1B,#2B	Memory (DIMM) Slots (1 through 4)
Floppy Connector	Floppy Disk Connector
IDE	IDE Connector
IPMI	IPMI 2.0 Socket
J9	Internal Speaker (Buzzer) Enable
JL1	Chassis Intrusion Header
JLED	Power LED Connector
JSLED	SATA LED Connector
JWOR	Wake-On-Ring Header
Keyboard/Mouse(J14)	PS/2 Keyboard/Mouse
LE1	Onboard +5V Standby Warning LED
LAN Ports	Giga-bit Ethernet RJ45 (LAN1/LAN2) Connectors
Parallel (J11)	Printer Port
PCI slots (*Note 2)	One: PCI 33MHz slot, One: PCI-X133/100MHz slot
PCI-E	Two PCI-Express x1 slots
SATA #0-3	4 SATA Headers
SCSI (*P8SC8)	SCSI Channel A, Channel B Connectors
SMB (J5)	System Management Bus Header
USB 0/1	Back Panel Universal Serial Ports1/2
USB 2/3/6/7 (J10, J7)	Front Panel USB Headers 2/3(J10), FPUSB 6/7(J7)
VGA	Video/Graphic Connector

(*Note: P8SC8 supports PCI-X 100MHz only. P8SCi supports PCI-X up to 133MHz.)

.
**Figure 1-3. Intel E7221 Copper River Chipset:
System Block Diagram**

Note: This is a general block diagram and may not exactly represent the features on your motherboard. See the following pages for the actual specifications of each motherboard.

Motherboard Features

CPU ◆ *Latest CPU technology!*
• Single Intel Pentium® 4 Processor in the 775-Land Grid Array Package at a system bus speed of 800 MHz.

Memory ◆ *Latest memory technology!*
• Dual/Single Channel DDR2 533/400 (using x8 DRAMTechnologies) up to 4 GB of ECC/Non ECC, unbuffered two-way interleaved DDR2-533/400 SDRAM in 4 DIMMS **Note: See Section 2-4 for details.**

Chipset ◆ *Latest Intel chipset technology!*
• Intel E7221 (Copper River)

Expansion Slots
• Two (2) PCI-Express x1
• One (1) PCI-X up to 133MHz (*P8SCi), PCI-X 100MHz (*P8SC8)
• One (1) 32-bit PCI

BIOS
• 8 Mb Firmware Hub AwardBIOS® Flash BIOS
• APM 1.2, DMI 2.3, PCI 2.2, ACPI 1.0, Plug and Play (PnP)

PC Health Monitoring
• Eight onboard voltage monitors for CPU core, +3.3V, +5V,+5VStandby, +1.5V, VBATT, and ±12V
• Fan status monitor with firmware/software speed control
• SuperDoctor III, Watch Dog, NMI
• Environmental temperature monitoring via BIOS
• Power-up mode control for recovery from AC power loss
• System resource alert via Supero Doctor III
• Hardware BIOS virus protection
• Auto-switching voltage regulator for the CPU core

ACPI Features

- Microsoft OnNow
- Slow blinking LED for suspend state indicator
- BIOS support for USB keyboard
- Main switch override mechanism
- Internal/external modem ring-on

Onboard I/O

- Adaptec 7902(B0) dual channel Ultra 320 SCSI (*P8SC8 only)
- Adaptec SCSI RAID 2010S supported (*P8SC8 only)
- 1 UDMA IDE
- Intel ICH6R SATA Controller 4 connectors for 4 devices
- 1 floppy port interface (up to 2.88 MB)
- 2 Fast UART 16550 compatible serial connectors (1 header, 1 port)
- 2 Broadcom 5721 PCI-Exp. Gigabit Ethernet Controllers
- 1 EPP (Enhanced Parallel Port) and ECP (Extended Capabilities Port) supported parallel port
- PS/2 mouse and PS/2 keyboard ports
- Up to 6 USB (Universal Serial Bus) 2.0 ports for a speed of up to 480Mbps ◆ *Latest USB 2.0 technology!*
- 1 VGA Connector
- 1 IPMI 2.0 Socket

Other

- Hyper-threading enabled
- Wake-on-Ring (WOR)
- Wake-on-LAN (WOL)
- Multiple CPU clock frequency ratio selections (set in BIOS)
- Onboard +5vsb warning LED ("LE1")

CD Utilities

- BIOS flash upgrade utility

Dimensions

- ATX form factor, 12" x 9.5" (305 x 228.6 mm)

1-2   Chipset Overview

Intel's E7221 (Copper River) chipset, designed for the server market, con-
sists of the following components: the Graphics Memory Controller Hub
(GMCH), Intel PCI-X Hub (PXH-V), and Intel I/O Controller Hub (ICH6R). The
E7221 (Copper River) chipset provides the performance and feature-set
required for the entry level single-processor server solutions.

Graphics Memory Controller Hub (GMCH)

The function of the GMCH is to manage the data flow between five inter-
faces: Processor/Host interface (FSB), System Memory Interface (DRAM
controller), PCI Express Interface, Direct Media Interface (DMI) and PXH-V
Interface. The GMCH is optimized for the Prescott processors in an
LGA775 Package. It supports one or two channels of unbuffered, ECC/Non
ECC DDR2 533/400 SDRAM.

The ACPI component provides the data buffering and interface arbitration
required to ensure that system interfaces operate efficiently. The Direct
Media Interface (DMI) is a point-to-point interconnect between the Copper
River GMCH and the ICH6.

Intel ICH6R System Features

The I/O Controller Hub provides the I/O subsystem with access to the rest
of the system. Functions and capabilities include:

*PCI Express Base Specification, Rev. 1.0a-compliant

*PCI 2.3

*ACPI Power Management Logic Support

*USB host interface

*Enhanced DMA Controller

*System Management Bus

*Low Pin Count (LPC) Interface

*Firmware Hub (FWH) Interface

Graphics Features/Display

The Copper River GMCH provides an integrated server-quality onboard
graphics.

1-3   PC Health Monitoring

This section describes the PC health monitoring features of the P8SC8/
P8SCi. The motherboard has an onboard System Hardware Monitor chip
that supports PC health monitoring.

Eight Onboard Voltage Monitors for the CPU Core, Chipset Voltage, +3.3V, +5V, +5V Standby, 1.5V, VBAT, and ±12V

The onboard voltage monitor will scan these voltages continuously. Once a
voltage becomes unstable, it will give a warning or send an error message
to the screen. Users can adjust the voltage thresholds to define the sensi-
tivity of the voltage monitor.

Fan Status Monitor with Firmware/Software Speed Control

The PC health monitor can check the RPM status of the cooling fans. The
onboard fans are controlled by thermal management via BIOS.

CPU Overheat/Fan Fail LED and Control

This feature is available when the user enables the CPU overheat/Fan Fail
warning function in the BIOS. This allows the user to define an overheat
temperature. When this temperature is exceeded or when a fan failure
occurs, then, the Overheat/Fan Fail warning LED is triggered.

Auto-Switching Voltage Regulator for the CPU Core

The 3-phase-switching voltage regulator for the CPU core can support up to
60A current and auto-sense voltage IDs ranging from 0.875 V to 1.6V. This
will allow the regulator to run cooler and thus make the system more stable.

1-4   CPU Thermal Management

Thermal Management 2 (TM2)

When TM2 is enabled in the BIOS and the CPU temperature reaches a pre-
defined threshold, a thermal monitoring mechanism will reduce the process
speed by lowering the bus-to-core ratio of the processor core clock and
decrease the voltage input by changing the CPU VID. This combination of
reduced CPU bus frequency and CPU VID effectively decreases CPU power

consumption to prevent processor overheat from happening and thus, greatly increases system stability. (*This function is available for the CPUs that support TM2.)

1-5 Power Configuration Settings

This section describes features of your motherboard that deal with power and power settings.

Microsoft OnNow

The OnNow design initiative is a comprehensive, system-wide approach to system and device power control. OnNow is a term for a PC that is always on but appears to be off and responds immediately to user or other requests.

Slow Blinking LED for Suspend-State Indicator

When the CPU goes into a suspend state, the chassis power LED will start blinking to indicate that the CPU is in suspend mode. When the user presses any key, the CPU will wake-up and the LED will automatically stop blinking and remain on.

BIOS Support for USB Keyboard

If the USB keyboard is the only keyboard in the system, it keyboard will function like a normal keyboard during system boot-up.

Main Switch Override Mechanism

When an ATX power supply is used, the power button can function as a system suspend button. When the user depresses the power button, the system will enter a SoftOff state. The monitor will be suspended and the hard drive will spin down. Depressing the power button again will cause the whole system to wake-up. During the SoftOff state, the ATX power supply provides power to keep the required circuitry in the system alive. In case the system malfunctions and you want to turn off the power, just depress and hold the power button for 4 seconds. The power will turn off and no power will be provided to the motherboard.

Wake-On-LAN (WOL)

Wake-On-LAN is defined as the ability of a management application to remotely power up a computer that is powered off. Remote PC setup, updates and access tracking can occur after hours and on weekends so that daily LAN traffic is kept to a minimum and users are not interrupted. The

motherboard has a 3-pin header (WOL) to connect to the 3-pin header on a Network Interface Card (NIC) that has WOL capability. Wake-On-LAN must be enabled in BIOS. Note that Wake-On-LAN can only be used with an ATX 2.01 (or above) compliant power supply.

Wake-On-Ring (WOR) Header

Wake-up events can be triggered by a device such as the external modem ringing when the system is in the SoftOff state. Note that external modem ring-on can only be used with an ATX 2.01 (or above) compliant power supply.

1-6 Power Supply

As with all computer products, a stable power source is necessary for proper and reliable operation. It is even more important for processors that have high CPU clock rates of 1 GHz and faster.

The **SUPER**● P8SC8/P8SCi accommodates 12V ATX power supplies. Although most power supplies generally meet the specifications required by the CPU, some are inadequate. A 2 amps of current supply on a 5V Standby rail is strongly recommended.

It is strongly recommended that you use a high quality power supply that meets 12V ATX power supply Specification 1.1 or above. Additionally, in areas where noisy power transmission is present, you may choose to install a line filter to shield the computer from noise. It is recommended that you also install a power surge protector to help avoid problems caused by power surges.

*Warning: Do not use a wrong type of onboard CMOS battery or install the onboard CMOS battery upside down to avoid any possible explosion.

1-7   Super I/O

The disk drive adapter functions of the Super I/O chip include a floppy disk drive controller that is compatible with industry standard 82077/765, a data separator, write pre-compensation circuitry, decode logic, data rate selection, a clock generator, drive interface control logic and interrupt and DMA logic. The wide range of functions integrated onto the Super I/O greatly reduces the number of components required for interfacing with floppy disk drives. The Super I/O supports two 360 K, 720 K, 1.2 M, 1.44 M or 2.88 M disk drives and data transfer rates of 250 Kb/s, 500 Kb/s or 1 Mb/s.

It also provides two high-speed, 16550 compatible serial communication ports (UARTs), one of which supports serial infrared communication. Each UART includes a 16-byte send/receive FIFO, a programmable baud rate generator, complete modem control capability and a processor interrupt system. Both UARTs provide legacy speed with baud rate of up to 115.2 Kbps as well as an advanced speed with baud rates of 250 K, 500 K, or 1 Mb/s, which support higher speed modems.

The Super I/O provides functions that comply with ACPI (Advanced Configuration and Power Interface), which includes support of legacy and ACPI power management through a SMI or SCI function pin. It also features auto power management to reduce power consumption.

The IRQs, DMAs and I/O space resources of the Super I/O can be flexibly adjusted to meet ISA PnP requirements, which support ACPI and APM (Advanced Power Management).

Notes

Chapter 2
Installation

2-1 Static-Sensitive Devices

Electric Static Discharge (ESD) can damage electronic components. To prevent damage to your system board, it is important to handle it very carefully. The following measures are generally sufficient to protect your equipment from ESD.

Precautions

• Use a grounded wrist strap designed to prevent static discharge.
• Touch a grounded metal object before removing the board from the anti-static bag.
• Handle the board by its edges only; do not touch its components, peripheral chips, memory modules or gold contacts.
• When handling chips or modules, avoid touching their pins.
• Put the motherboard and peripherals back into their antistatic bags when not in use.
• For grounding purposes, make sure your computer chassis provides excellent conductivity between the power supply, the case, the mounting fasteners and the motherboard.
• Use only the correct type of CMOS onboard battery as specified by the Manufacturer. Do not install the CMOS onboard battery upside down to avoid a possible explosion.

Unpacking

The motherboard is shipped in antistatic packaging to avoid static damage. When unpacking the board, make sure the person handling it is static protected.

Installation Procedures

Follow the procedures as listed below for full installation of the motherboard into a chassis:

1. Install the processor and the heatsink to the motherboard.
2. Install the motherboard in the chassis.
3. Install the memory and add-on cards.
4. Finally, connect the cables and install the drivers.

2-2   LGA775 Processor and Heatsink Fan Installation

⚠️ *When handling the processor package, avoid placing direct pressure on the label area of the fan.*

IMPORTANT: Always connect the power cord last and always remove it before adding, removing or changing any hardware components. Make sure that you install the processor into the CPU socket before you install the CPU heatsink.

Installation of the LGA775 Processor

New CPU Socket (w/ plastic cap on)

1. Press the socket lever to release the load plate that covers the CPU socket from its locking position.

Socket Lever
Load Plate

2. Carefully lift the socket lever up to open the load plate.

Load Plate
3. Locate Pin 1 on the CPU socket. (*Note: Pin 1 is the corner marked with a triangle). Please note that the North Key and the South Key are located vertically in the CPU housing.

North Key

Pin 1

4. Position the motherboard in such a way that Pin 1 of the CPU socket is located at the left bottom of the CPU housing.

South Key

North Center Edge

5. Use your thumb and your index finger to hold the CPU at the North Center Edge and the South Center Edge of the CPU.

6. Align Pin 1 of the CPU with Pin 1 of the socket. Once aligned, carefully lower the CPU straight down to the socket. (**Do not drop the CPU on the socket. Do not move the CPU horizontally or vertically. Do not rub the CPU against the surface of the socket or against any pins of the socket to avoid damage to the CPU or the socket.)

South Center Edge

Socket Lever

7. With the CPU inside the socket, inspect the four corners of the CPU to make sure that the CPU is properly installed.

CPU in the CPU socket

8. Use your thumb to gently press the lever down and lock it in the hook.

9. If the CPU is properly installed into the socket, the plastic cap will be automatically released from the load plate when the lever is pushed into the hook. Remove the plastic cap from the motherboard.

Plastic cap is released from the load plate if the CPU is properly installed.
Installation of the Heatsink

1. Locate the CPU Fan on the motherboard. (Refer to the layout on Page 1-4 for the CPU Fan location.)

2. Position the heatsink in such a way that the heatsink fan wires are closest to the CPU fan and are not interfered with other components

3. Inspect the CPU Fan wires to make sure that the wires are routed through the bottom of the heatsink.

4. Remove the thin layer of the protective film from the copper core of the heatsink.

(*Warning: CPU overheat may occur if the protective film is not removed from the heatsink.)

5. Apply the proper amount of thermal grease on the CPU. (*Note: if your heatsink came with a thermal pad, please ignore this step.)

Thermal Grease

CPU
6. If necessary, rearrange the wires to make sure that the wires are not pinched between the heatsink and the CPU. Also make sure to keep clearance between the fan wires and the fins of the heatsink.

Fan Wires
Heatsink Fins

7. Align the four heatsink fasteners with the mounting holes on the motherboard. Gently push the fasteners into the mounting holes until you hear a "click".
Heatsink Fastener

8. Repeat Step 6 to insert all four heatsink fasteners into the mounting holes.

9. Once all four fasteners are securely inserted into the mounting holes and the heatsink is properly installed on the motherboard, connect the heatsink fan wires to the CPU Fan connector.

Heatsink Removal

1. Unplug the power cord from the power supply.

2. Disconnect the heatsink fan wires from the CPU fan header.

3. Use your finger tips to gently press on the fastener cap and rotate counter-clockwise to make a 1/4 (90^0) turn.

4. Repeat Step 3 to loosen all fasteners from the mounting holes.

5. With all fasteners loosened, remove the heatsink from the CPU.

2-3   Mounting the Motherboard in the Chassis

All motherboards have standard mounting holes to fit different types of chassis. Make sure that the locations of all the mounting holes for both the motherboard and the chassis match. Although a chassis may have both plastic and metal mounting fasteners, metal ones are highly recommended because they ground the motherboard to the chassis. Make sure that the metal standoffs click in or are screwed in tightly. Then, use a screwdriver to secure the motherboard onto the motherboard tray.   (***Note:** some components are very close to the mounting holes, please take caution to prevent damage done to these components when installing the motherboard into the chassis.)

2-4 Installing DDR2 Memory

CAUTION
Exercise extreme care when installing or removing memory
modules to prevent any possible damage.

Memory Module Installation (See Figure 2-2)

1. Insert each DDR2 memory module vertically into its slot. Pay attention
    to the notch along the bottom of the module to prevent inserting the
    module incorrectly.   (See support information below.)
2. Gently press down on the memory module until it snaps into place.

Support

The P8SC8/P8SCi supports Dual channel, ECC/Non ECC, unbuffered
DDR2 533/ 400 SDRAM. Both interleaved and non-interleaved memory
are supported, so you may populate any number of DIMM slots. (Popu-
lating DIMM#1A, DIMM#2A, and/or DIMM#1B, DIMM#2B with   memory
modules of the same size and of the same type will result in dual
channel, two-way interleaved memory which is faster than single
channel, non-interleaved memory.)

Figure 2-2. DDRII Installation

To Install:
Insert module
vertically and
press down
until it snaps
into place.
Pay attention
to the notch.
To Remove:
Use your thumbs
gently to push
each release tab
outward to
release the DIMM
from the slot.
2-5   I/O Port/Control Panel Connector Locations

The I/O ports are color coded in conformance with the PC99 specification to make setting up your system easier. See Figure 2-3 below for the colors and locations of the various IO ports.

Figure 2-3.   I/O Port Locations and Definitions

Mouse (Green)

Parallel Port (Burgundy)

Keyboard (Purple)   **USB 0/1 Ports**   **COM1 Port (Turquoise)**   **VGA Port**   **GLAN1**   **GLAN2**
Front Control Panel

JF1 contains header pins for various front control panel connectors. See Figure 2-4 for the pin definitions of the various connectors including the speaker. Refer to Section 2-6 for details.

Power Supply Connectors

The primary power supply connector (J1) on the P8SC8/P8SCi meets the SSI (Superset ATX) 24-pin specification. Refer to the table on the right for the pin definitions of the ATX 24-pin power connector. You must also connect the 4-pin (J2) processor power connector to your power supply. Refer to the table below right for the J2 (12V) connector.

ATX Power Supply 24-pin Connector Pin Definitions (J1)

3V Standby	○	○	Signal Power Button
	2	1	
Power On_LED Connector

The Power LED connector is located on pins 15, 16 of JF1. (*Use JLED for a 3-pin connector.) This connection is used to provide LED indication of power being supplied to the system. See the table on the right for pin definitions.

Power_LED Pin Definitions (JF1)	
Pin Number	Definition
15	+5V
16	Ground

NMI Button

The non-maskable interrupt button header is located on pins 19 and 20 of JF1. Refer to the table on the right for pin definitions.

NMI Button Pin Definitions (JF1)	
Pin Number	Definition
19	Control
20	Ground
Serial Ports

Two serial ports are included on the motherboard: COM1 is a port located beside the mouse/keyboard ports and COM2 is a header located below the Floppy Drive. See the table on the right for pin definitions.

*NC indicates no connection.

Serial Port Pin Definitions (COM1)

Pin Number	Definition	Pin Number	Definition
1	CD	6	DSR
2	RD	7	RTS
3	TD	8	CTS
4	DTR	9	RI
5	Ground		

Serial Port Pin Definitions (COM2)

Pin Number	Definition	Pin Number	Definition
1	CD	6	DSR
2	RD	7	RTS
3	TD	8	CTS
4	DTR	9	RI
5	Ground	10	NC

Speaker Connector

The speaker connector is located on J9 and allows you to choose between using the internal or an external speaker. For the internal speaker, short Pins 3 and 4. To use an external speaker, place the speaker cable header on the speaker connector. See the table on the right for pin definitions.

Speaker: Pin Definition

Fucntion	Pin Definition
Pins 1- 4	External Speaker
Pins 3, 4	Internal Speaker
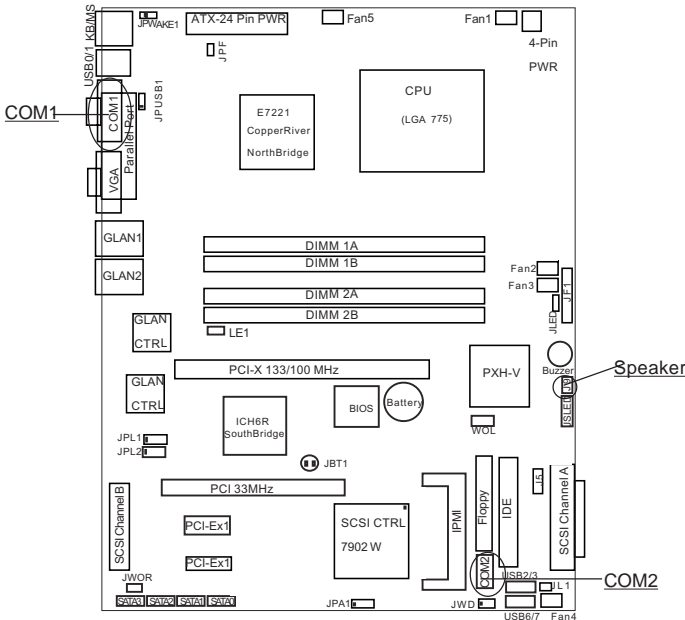

Fan Headers

There are five fan headers (Fan 1 to Fan5) on the P8SC8/P8SCi. See the table on the right for pin definitions. These fan headers support 3-pin fans. The fan speed is controlled by Thermal Management under the Hardware Monitoring Section in the BIOS.

3-pin Fan Header Pin Definitions

Pin Number	Definition
1	Ground (black)
2	+12V (red)
3	Tachometer

*Caution: Fan headers use DC power.

Chassis Intrusion

The Chassis Intrusion header is located at JL1. See the board layout in Chapter 1 for the location of JL1 and the table on the right for pin definitions.

Chassis Intrusion Pin Definitions (JL1)

Pin Number	Definition
1	Intrusion Input
2	Ground
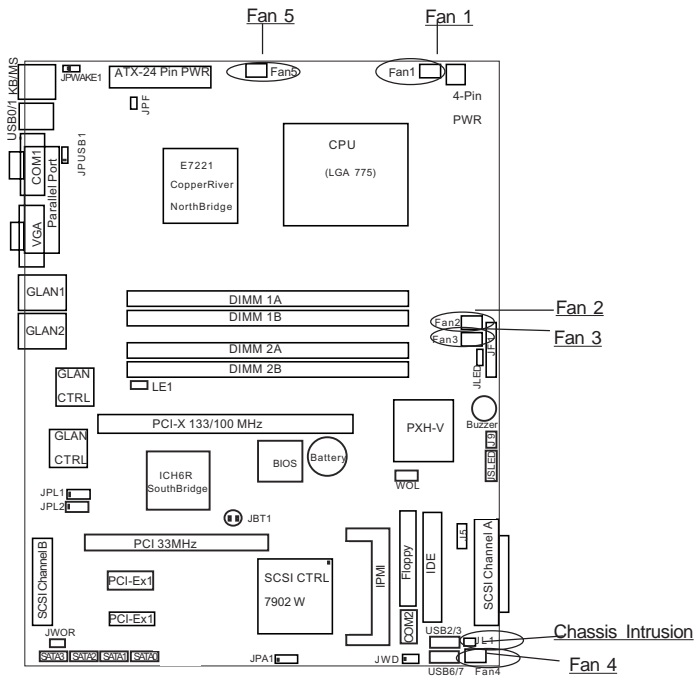

ATX PS/2 Keyboard and PS/2 Mouse Ports

The ATX PS/2 keyboard and the PS/2 mouse are located at J14. See the table on the right for pin definitions. (The mouse port is above the keyboard port. See the table on the right for pin definitions.)

Wake-On-Ring

The Wake-On-Ring header is located at JWOR. This function allows your computer to be "awakened" by an in-coming call when in the suspend state. See the table on the right for pin defi-nitions. You must also have a WOR card and cable to use WOR.

Wake-On-Ring Pin Definitions (JWOR)	
Pin Number	Definition
1	Ground
2	Wake-up

Wake-On-LAN

The Wake-On-LAN header(JWOL) is designated WOL on the mother-board. See the table on the right for pin definitions. You must en-able the LAN Wake-Up setting in BIOS to use this function. (You must also have a LAN card with a Wake-On-LAN connector and cable to use this feature.)

Wake-On-LAN Pin Definitions (JWOL)	
Pin Number	Definition
1	+5V Standby
2	Ground
3	Wake-up
VGA Connector

A VGA connector (JG1) is located next to the COM1 on the IO backplane. Refer to the board layout below for the location.

Giga-bit LAN (Ethernet) Ports

There are two RJ45 Ethernet (Gigabit LAN) ports located on the IO backplane.

SMB Header

A System Management Bus header is located at J5. Connect the appropriate cable here to utilize SMB on your system.

**SMB Header

2-7   Jumper Settings

Explanation of Jumpers

To modify the operation of the motherboard, jumpers can be used to choose between optional settings. Jumpers create shorts between two pins to change the function of the connector. Pin 1 is identified with a square solder pad on the printed circuit board. See the motherboard layout pages for jumper locations.

Note: On a two-pin jumper, "Closed" means the jumper is on both pins and "Open" means the jumper is either on only one pin or completely removed.

Connector Pins

Jumper Cap

Setting

Pin 1-2 short
CMOS Clear

JBT1 is not actually a jumper but consists of two contact pads. To clear the contents of CMOS, short these pads together by touching them both with a metal conductor such as the head of a small screwdriver. JBT1 is located near the SATA header on the P8SC8/ P8SCi. **Note:** for ATX power supplies, you must com- pletely shut down the system and remove the AC power cord before clearing CMOS.
USB Wake-Up

Use JPUSB1 to enable or disable USB Wake-Up, which allows you to wakeup the system by de-pressing a key on the keyboard or by clicking the mouse when either is connected to the USB1 or USB2 port. This jumper is used together with the USB Wake-Up function in BIOS. Enable both the jumper and the BIOS setting to allow the system to be woken up. See the table on the right for jumper settings.

**USB Wake-Up
Jumper Settings
(JPUSB1)**

Jumper Position	Definition
1-2	Enabled
2-3	Disabled

Keyboard Wake-Up

The JPWAKE1 jumper is used to-gether with the Keyboard Wake-Up function in BIOS. Enable both the jumper and the BIOS setting to allow the system to be woken up by depressing a key on the key-board. See the table on the right for jumper settings. Your power supply must meet ATX specifica-tion 2.01 or higher and supply 720 mA of standby power to use this feature.

**Keyboard Wake-Up
Jumper Settings
(JPWAKE1)**

Jumper Position	Definition
1-2	Enabled
2-3	Disabled
Gigabit LAN Enable

There are two Giga-bit Controllers located on the motherboard. Each GLAN Controller can be enabled via a jumper.   Close Pins 1 & 2 of JPL1 to enable the function of GLAN Controller 1, and close Pins 1 & 2 of JPL2 to enable the function of GLAN Controller 2 . See the table on the right for pin definitions.

GLAN Enable(JPL1, JPL2)

Pin#	Definitions
1-2	Enable
2-3	Disable

GLAN1 Enable
GLAN2 Enable
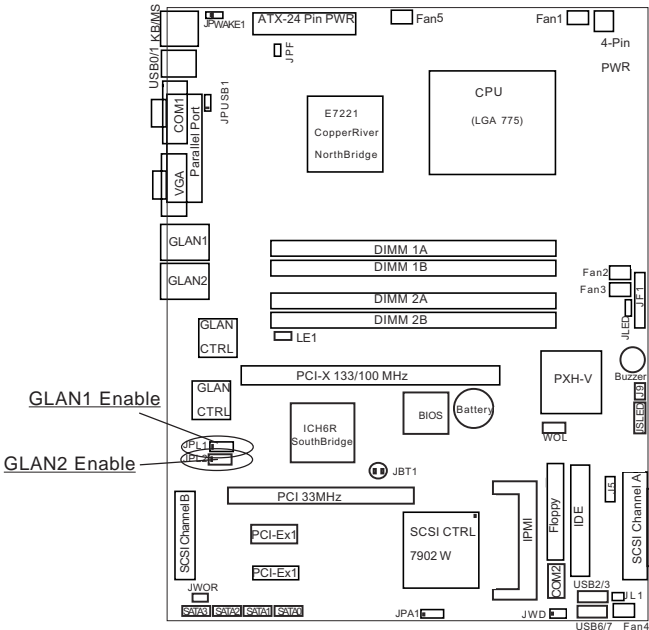

Force-Power-On Enable/ Disable

Jumper JPF allows you to enable or disable the function of Force-Power-On. If enabled, the power will always stay on automatically. If this function disabled, the user needs to press the power button to power on the system.

Force Power On (JPF)

Jumper Position	Definition
Open	Normal
Closed	Force On

SCSI Enable/Disable (*P8SC8 only)

The SCSI Enable/Disable jumper at JPA1 allows you to enable or disable the onboard SCSI. The normal (default) position is on pins 1-2 to enable SCSI. See the table on the right for jumper settings.

SCSI Enable/Disable Jumper Settings (JPA1)

Jumper Position	Definition
Pins 1-2	Enabled
Pins 2-3	Disabled

Force PWR- On

SCSI Enable
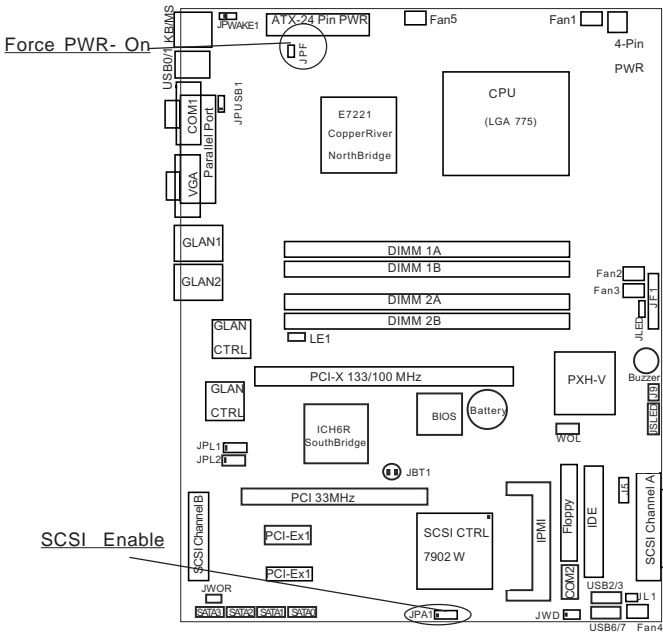

Watch Dog Enable/Disable

JWD enables the Watch Dog function. Watch Dog is a system monitor that can reboot the system when a software application is "hung up". Pins 1-2 will cause WD to reset the system if an application is "hung up". Pins 2-3 will generate a non-maskable interrupt signal for the application that is "hung up". See the table on the right for jumper settings. <u>Watch Dog can also be enabled via BIOS. (*Note, when enabled, the user needs to write his own application software in order to disable the Watch Dog Timer.)</u>

Watch Dog
Jumper Settings (JWD)

Jumper Position	Definition
Pins 1-2	WD to Reset
Pins 2-3	WD to NMI
Open	Disabled
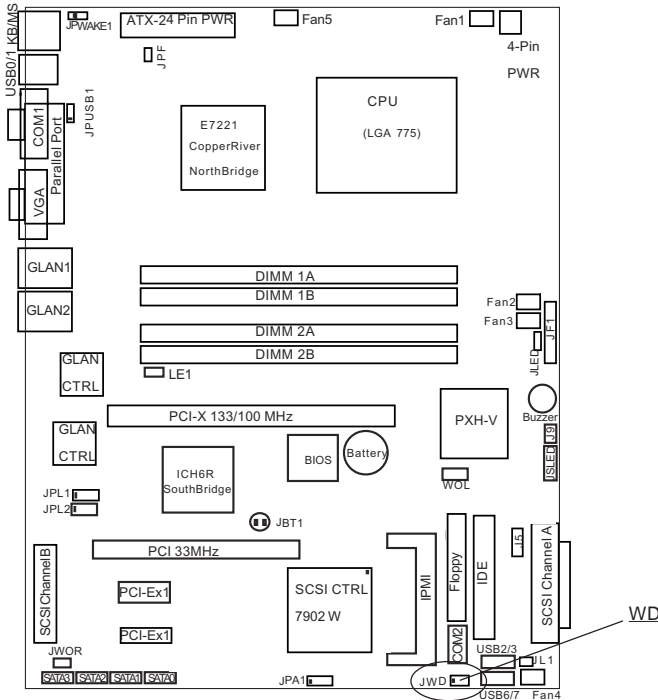

2-8   Onboard Indicators

GLAN LEDs

The Gigabit Ethernet LAN port (located beside the COM2 port) has two LEDs on the back of the connectors. The yellow LED indicates activity while the other LED may be green, orange or off to indicate the speed of the connection. See the table at right for the functions associated with the second LED.

Left Right
(Back Panel View)

1 Gb LAN Left LED Indicator (Speed LED)

LED Color	Definition
Off	No Connection
Green	10/100 MHz
Amber	1 GHz

1 Gb LAN Right LED Indicator(Activity LED)

LED Color	Definition
Amber	Blinking 10/100MHz/ 1GHz

GLAN1

GLAN2
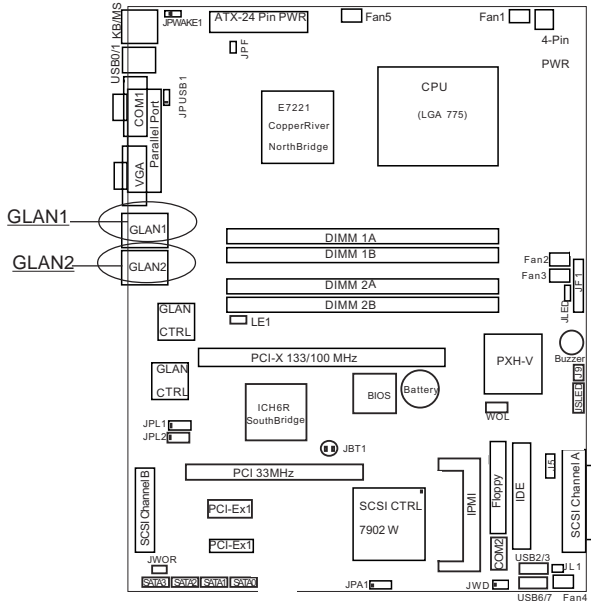

2-9 Parallel Port, Floppy Drive, Hard Drive, and SCSI Connections

Use the following information to connect the floppy and hard disk drive cables.

• The floppy disk drive cable has seven twisted wires.

• A red mark on a wire typically designates the location of pin 1.

• A single floppy disk drive ribbon cable has 34 wires and two connectors to provide for two floppy disk drives. The connector with twisted wires always connects to drive A, and the connector that does not have twisted wires always connects to drive B.

• The 80-wire ATA100/66 IDE hard disk drive cable that came with your system has two connectors to support two drives. This special cable should be used to take advantage of the speed this new technology offers. The blue connector connects to the onboard IDE connector interface and the other connector(s) to your hard drive(s). Consult the documentation that came with your disk drive for details on actual jumper locations and settings for the hard disk drive.

Parallel Port Connector

The parallel port is located next to the USB 0/1 Ports. Refer to Figure 2-3 for location. See the table on the right for pin definitions.

Parallel (Printer) Port Pin Definitions

Pin Number	Function	Pin Number	Function

SCSI Channel B

SCSI Channel A
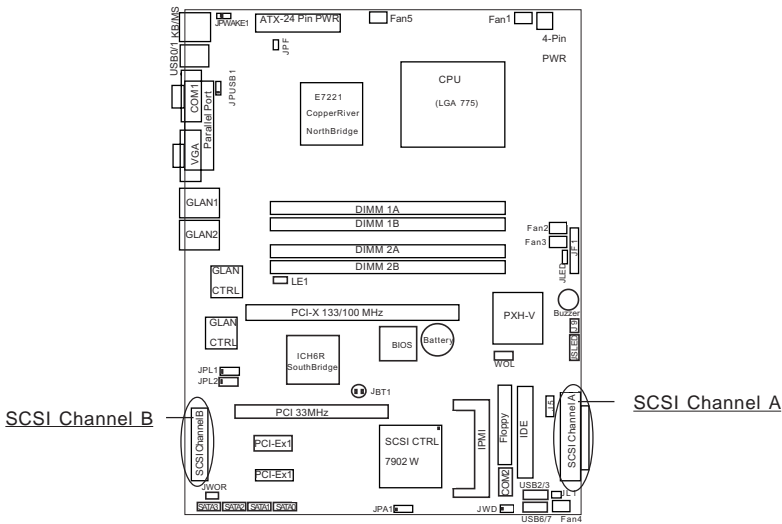

Chapter 3
Troubleshooting

3-1 Troubleshooting Procedures

Use the following procedures to troubleshoot your system. If you have followed all of the procedures below and still need assistance, refer to the 'Technical Support Procedures' and/or 'Returning Merchandise for Service' section(s) in this chapter. Always disconnect the AC power cord before adding, changing or installing any hardware components.

Before Power On

1. Check that the +5v standby LED is lit (LE2 on motherboard).
2. Make sure that the 4-pin 12v power connector at J2 is connected to your power supply.
3. Make sure that no short circuits exist between the motherboard and chassis.
4. Disconnect all ribbon/wire cables from the motherboard, including those for the keyboard and mouse.
5. Remove all add-on cards.
6. Install a CPU and heatsink (making sure that it is fully seated) and connect the chassis speaker and the power LED to the motherboard. Check all jumper settings as well.
7. Use the correct type of onboard CMOS battery as recommended by the Manufacturer. Do not install the CMOS battery upside down to avoid possible explosion.

No Power

1. Make sure that no short circuits exist between the motherboard and the chassis.
2. Verify that all jumpers are set to their default positions.
3. Check that the 115V/230V switch on the power supply is properly set.
4. Turn the power switch on and off to test the system.
5. The battery on your motherboard may be old. Check to verify that it still supplies ~3VDC. If it does not, replace it with a new one.

No Video

1. If the power is on but you have no video, remove all the add-on cards and cables.
2. Use the speaker to determine if any beep codes exist. Refer to Appendix A for details on beep codes.

NOTE

If you are a system integrator, VAR or OEM, a POST diagnos-
tics card is recommended. For I/O port 80h codes, refer to
App. B.

Memory Errors

1. Make sure that the DIMM modules are properly and fully installed.
2. You should be using unbuffered DDR2 memory (see next page). Also,
   it is recommended that you use the same memory speed for all
   DIMMs in the system. See Section 2-4 for memory limitations.
3. Check for bad DIMM modules or slots by swapping modules between
   slots and noting the results.
4. Check the power supply voltage 115V/230V switch.

Losing the System's Setup Configuration

1. Make sure that you are using a high quality power supply. A poor
   quality power supply may cause the system to lose the CMOS setup
   information. Refer to Section 1-6 for details on recommended power
   supplies.
2. The battery on your motherboard may be old. Check to verify that it
   still supplies ~3VDC. If it does not, replace it with a new one.
3. If the above steps do not fix the Setup Configuration problem, contact
   your vendor for repairs.

3-2   Technical Support Procedures

Before contacting Technical Support, please take the following steps. Also,
note that as a motherboard manufacturer, Supermicro does not sell directly
to end-users, so it is best to first check with your distributor or reseller for
troubleshooting services. They should know of any possible problem(s)
with the specific system configuration that was sold to you.

1. Please go through the 'Troubleshooting Procedures' and 'Frequently
 Asked Questions' (FAQs) sections in this chapter or see the FAQs on our
web site <http://www.supermicro.com/support/>   before contacting

Technical Support.

2. BIOS upgrades can be downloaded from our web site at http://www.supermicro.com/techsupport/download.htm.

Note: Not all BIOS can be flashed depending on the modifications to the boot block code.

3. If you still cannot resolve the problem, include the following information when contacting Supermicro for technical support:

• Motherboard model and PCB revision number

• BIOS release date/version (this can be seen on the initial display when your system first boots up)

• System configuration

An example of a Technical Support form is posted on our web site at http://www.supermicro.com/techsupport/contact_support.htm.

4. Distributors: For immediate assistance, please have your account number ready when contacting our technical support department by e-mail at support@supermicro.com.

3-3   Frequently Asked Questions

Question: What type of memory does my motherboard support?

Answer: The P8SC8/P8SCi supports up to 4 GB of ECC/Non-ECC, **unbuffered** DDR2-533/400, two-way interleaved or non-interleaved SDRAM. See Section 2-4 for details on installing memory.

Question: How do I update my BIOS?

Answer: It is recommended that you **not** upgrade your BIOS if you are not experiencing problems with your system. Updated BIOS files are located on our web site at http://www.supermicro.com/techsupport/BIOS/bios.htm. Please check our BIOS warning message and the information on how to update your BIOS on our web site. Also, check the current BIOS revision and make sure it is newer than your current BIOS before downloading. Select your mainboard model and download the BIOS file to your computer. Unzip the BIOS update file and you will find the readme.txt (flash instructions), the awdflash.exe (BIOS flash utility) and the BIOS image (xxxx.bin) files. Copy these files onto a bootable floppy and reboot your system. It is not necessary to set the BIOS boot block protection jumpers on the mainboard. At the DOS prompt upon rebooting, enter the command "awdflash." Then type in the BIOS file that you want to update (xxxx.bin).

Question: What's on the CD that came with my motherboard?

Answer: The supplied compact disc has quite a few drivers and programs that will greatly enhance your system. We recommend that you review the CD and install the applications you need. Applications on the CD include chipset drivers for Windows and security and audio drivers.

Question: Why can't I turn off the power using the momentary power on/off switch?

Answer: The instant power off function is controlled in BIOS by the Power Button Mode setting. When the On/Off feature is enabled, the motherboard will have instant off capabilities as long as the BIOS has control of the system. When the Standby or Suspend feature is enabled or when the BIOS is not in control such as during memory count (the first screen that appears when the system is turned on), the momentary on/off switch must be held for more than four seconds to shut down the system. This feature is required to implement the ACPI features on the motherboard.

Question: How do I connect the ATA100/66 cable to my IDE device(s)?

Answer: The 80-wire/40-pin high-density ATA100/66 IDE cable that came with your system has two connectors to support two drives. This special cable must be used to take advantage of the speed the ATA100/66 technology offers. **Connect the blue connector to the onboard IDE header and the other connector(s) to your hard drive(s).** Consult the documentation that came with your disk drive for details on actual jumper locations and settings.

Question: After I have installed 4 pieces of 1GB Memory, why does the BIOS only detect about 3.15 GB of memory during POST?

Answer: Because the chipset does not support memory remapping, so there is a memory hole located around the 4GB memory address.

Question: What are the function keys for the IPMIVIEW?

ESC O P - F1 KEY
ESC P Q - F2 KEY
ESC ESC - ESC KEY
CTRL M - ENTER KEY
CTRL H - BACKSPACE KEY
CTRL I - TAB KEY
ESC S - SIGNAL TRANSFER REQUEST
ESC c - REBOOT SYSTEM
ESC d - ALT key on
ESC e - CTRL key on
<Tab>-Enter BIOS Setup

3-4   Returning Merchandise for Service

A receipt or copy of your invoice marked with the date of purchase is required before any warranty service will be rendered. You can obtain service by calling your vendor for a Returned Merchandise Authorization (RMA) number. When returning to the manufacturer, the RMA number should be prominently displayed on the outside of the shipping carton, and mailed prepaid or hand-carried. Shipping and handling charges will be applied for all orders that must be mailed when service is complete.

This warranty only covers normal consumer use and does not cover damages incurred in shipping or from failure due to the alteration, misuse, abuse or improper maintenance of products.

During the warranty period, contact your distributor first for any product problems.

Notes

Chapter 4
BIOS

4-1   Introduction

This chapter describes the AwardBIOS for the P8SC8/P8SCi. The Award
ROM BIOS is stored in a Flash chip and can be easily upgraded using a
floppy disk-based program.

Note: Due to periodic changes to the BIOS, some settings may have been
added or deleted and might not yet be recorded in this manual. Refer to the
Manual Download area of our web site for any changes to the BIOS that
are not reflected in this manual.

System BIOS

The BIOS is the Basic Input Output System used in all IBM® PC, XT™, AT®,
and PS/2® compatible computers. The AwardBIOS Flash chip stores the
system parameters, such as amount of memory, type of disk drives and
video displays, etc. CMOS requires very little power. When the computer
is turned off, a back-up battery provides power to the BIOS Flash chip,
enabling it to retain the system parameters. Each time the computer is pow-
ered-on, the computer is then configured with the values stored in the BIOS
ROM by the system BIOS, which gains control when the computer is pow-
ered on.

How To Change the Configuration Data

The CMOS information that determines the system parameters may be
changed by entering the BIOS Setup utility. This Setup utility can be ac-
cessed by pressing <Del> at the appropriate time during system boot.

Starting the Setup Utility

Normally, the only visible POST (Power On Self Test) routine is the memory
test. As the memory is being tested, press the <Delete> key to enter the
main menu of the BIOS Setup utility. From the main menu, you can access
the other setup screens, such as the Chipset and Power menus. Section 4-
3 gives detailed descriptions of each parameter setting in the Setup utility.

4-2   Running Setup

Optimal default settings are in bold text unless otherwise noted.

The BIOS setup options described in this section are selected by choosing the appropriate text from the Main BIOS Setup screen. All displayed text is described in this section, although the screen display is often all you need to understand how to set the options (see on next page).

When you first power on the computer, the AwardBIOS™ is immediately activated.

While the BIOS is in control, the Setup program can be activated in one of two ways:

1.   By pressing <Del> immediately after turning the system on, or
2.   When the following message appears briefly at the bottom of the screen during the POST (Power On Self-Test), press the <Del> key to activate the Main Setup Menu.

Press DEL to enter SETUP

4-3   Main BIOS Setup

All Main Setup options are described in this section. The Main BIOS Setup screen is displayed below.

Use the <Up> <Down> arrow keys or the <Tab> key to move among the different settings in the above menu.

Press the <Esc> key to exit the CMOS Setup Menu and use the <Left> <Right> arrow keys to enter the other categories of the BIOS settings. The next section is described in detail to illustrate how to navigate through the menus.

Main BIOS Setup Menu

```

Date/Time

Set the system date and time. Key in the correct information in the "mm", "dd" and "yy" fields. Press the "Enter" key to save the data.

Legacy Diskette A/Legacy Diskette B

This setting allows the user to set the type of floppy disk drive installed as diskette A and diskette B. The options are None, 360Kb 5.25 in, 1.2MB 5.25 in, 720Kb 3.5 in, **1.44/1.25MB**, 3.5 in and 2.88MB 3.5 in.

Swap Floppy Drive

If the system has two floppy drives, enable this feature to assign physical drive B to logical drive A or physical drive A to logic drive B. The options are Enabled and **Disabled**.

▶ IDE Channel 0 Master/Slave, IDE Channel 1 Master/Slave, IDE Channel 2 Master/Slave, IDE Channel 3 Master/Slave

These settings allow the user to set the parameters of the IDE Channel 0 Master/Slave to IDE Channel 3 Master/Slave slots. Hit <Enter> to activate the following sub-menu screen for detailed options of these items. Set the correct configurations accordingly. The items included in the submenu are:

```
            Phoenix - AwardBIOS CMOS Setup Utility
 Main

          IDE Channel 0 Master                    Item Help

     F5:Previous Values    F6:Fail-Safe Defaults   F7:Optimized Defaults
```

IDE HDD Auto-Detection

This option allows the user to determine the manner in which the AwardBIOS sets the settings for IDE Channel 0 to IDE Channel 3 Master Devices. The options are "None", "**Auto**" and "Manual."

IDE Channel 0 to IDE Channel 3 Master

Press the <Enter> key to activate the 'IDE HDD Auto-Detection" function, which will allow the BIOS to automatically detect the status of the IDE HDD installed in the system, such as the size, the number of cylinders, the configurations of items such as Head, Precomp, Landing Zone and Sector. The options are None, **Auto** and Manual.

Access Mode

This item determines the location through which the AwardBIOS accesses the IDE Primary Master Device. The settings are "CHS", "LBA", "Large", and "**Auto**".

Halt On

This item allows the user to select the situation in which the BIOS will stop the POST process and notify you about the status of the system. The settings are **"All Errors"**, "No Errors", "All, But Keyboard", "All, But Diskette", and "All, But Disk/Key".

Total Physical Memory/Total System Resources/Total Available Memory

These are displays that inform you how much of each type of memory is recognized as being present in the system.

4-4   Advanced BIOS Setup

Choose the Advanced BIOS Setup from the Award BIOS main menu with the Left/Right arrow keys.   You should see the following display. Select one of the items in the left frame of the screen to go to the sub screen for that item. The Advanced BIOS Setup options are displayed by highlighting the option using the arrow keys. All Advanced BIOS Setup options are described in this section.

```

```

Quick Boot

If enabled, this feature allows the system to skip certain tests while booting. This will decrease the time needed to boot the system. The settings are "**Enabled**" and "Disabled".

Quiet Boot

This feature allows the user to enable "Quiet Boot". When set to Enabled, the BIOS is in the graphic mode and displays only an OEM Logo during POST while booting. If an error occurs, The system will automatically switch to the text mode. The options are "**Enabled**" and "Disabled".

ACPI Function

Select "Enabled" to enable BIOS Support for the Advanced Configuration and Power Interface features. The settings are "**Enabled**" or "Disabled".

APIC Mode

This setting allows you to **Enable** or Disable APIC. APIC is used to assign interrupt signals to a specific processor on a multiprocessor system and provides IRQs beyond the conventional 16 under Windows 2000 or XP. It has no effect on single processor systems.

MPS Version Control

This setting allows you to select the MPS version for your operating system. The options are "1.1" and "**1.4**".

Watch Dog Timer Select

This setting is for enabling the Watch Dog feature. The options are Enabled and **Disabled**. (Please refer to Chapter 2 for more details.)

PWRON After PWR-Fail

This setting allows the user to determine how the system will respond when power is reapplied after a system shut down caused by power failure. The options are "**Off**", "On" and "Former-Sts".

4-4.2 Advanced Chipset Control

```
              Phoenix - AwardBIOS CMOS Setup Utility
    Advanced

         Advanced Chipset Control                  Item Help

    On-Chip Serial ATA       [Enhanced Mode]
  x PATA IDE Mode             Primary
    SATA Port                 P1,P3 is Secondary

    USB Controller           [Enabled]
    USB 2.0 Controller       [Enabled]
    USB Legacy Support       [Disabled]

  ↑↓→←:Move  Enter:Select  +/-/PU/PD:Value  F10:Save  ESC:Exit  F1:General Help
       F5:Previous Values    F6:Fail-Safe Defaults   F7:Optimized Defaults
```

DRAM Data Integrity Mode

If enabled, this feature allows the data stored in the DRMA memory to be integrated for faster data processing. The options are **ECC** and Non-ECC.

On-Chip Frame Buffer Size

This setting allows you to set On-Chip Frame Buffer Size. The options are "1 MB" and "**8 MB.**"

SATA Mode

This feature allows you to select the channel for SATA mode. The options are "**IDE**", "RAID" and "AHCI (-Advanced Host Controller Interface)."

On-Chip Serial ATA

Select "Disabled" to disable the SATA Controller. Select "**Auto**" to allow the BIOS to configure the SATA Controller automatically. Select "Combined Mode" to use PATA and SATA Combined Mode. The maximum of 2 IDE drives in each channel is allowed. Select "Enhanced Mode" to enable both SATA and PATA. This mode will support up to 6 IDE drives. Select "SATA Only" to allow SATA to operate in "Legacy Mode".

PATA IDE Mode

When the item -On-chip Serial ATA is set to Combined Mode, the user can select either Primary or Secondary for Parallel ATA IDE. The options are **Primary** and Secondary. If On-chip Serial ATA is set to Enhanced Mode, only Serial ATA will be activated, and Primary PATA IDE will be available. Secondary PATA IDE will not be available.

SATA Port

This setting allows you configure the setting for the SATA port. The options are **P1** and P3 is Secondary.

USB Controller

This setting allows you to enable or disable the USB Controller. The options are **Enabled**, and Disabled.

USB 2.0 Controller

This setting allows you to enable or disable USB 2.0 (EHCI) Controller. The options are **Enabled**, and Disabled.

USB Legacy Support

This setting allows you to enable or disable the functions of USB, Keyboard/Mouse under POST and DOS. The options are **"Disabled"**, and "Enabled."

4-4.3 I/O Device Configuration

```
              Phoenix - AwardBIOS CMOS Setup Utility
   Advanced

           I/O Device Configuration                    Item Help

   Onboard Serial Port 1        [3F8/IRQ4]       Menu Level    ▶▶

       F5:Previous Values   F6:Fail-Safe Defaults   F7:Optimized Defaults
```

Onboard Serial Port1/Onboard Serial Port2

This setting allows the user to set the address and the corresponding IRQ for Serial Port1 and Serial Port 2.   The options are "Disabled" , "3F8/IRQ4", "2F8/IRQ3", "3E8/IRQ4", "2E8/IRQ3", and "Auto". The default setting for Serial Port1 is "**3F8/IRQ4**" and the default for Port 2 is "**2F8/IRQ3**".

UART Mode Select

This setting allows the user to select the UART mode for the BIOS. The options are "IrDA", "ASKIR" and "**Normal**."

RxD, TxD Active

This allows the user to change the settings for the "RxD, TxD Active" function. The options are "Hi, Hi", "**Hi, Lo**", "Lo, Hi", and "Lo, Lo".

IR Transmission Delay

If "Enabled", the transmission of IR (infrared) signals will be delayed. The settings are "**Enabled**" and "Disabled".

UR2 Duplex Mode

This setting sets the mode for the UR2 Duplex Mode. The options are "Full" and "**Half**".

Use IR Pins

This item sets the usage of the IR pins. The options are "RxD2, TxD2" and "**IR-Rx2Tx2**".

Onboard Parallel Port

This setting allows the user to set the address and the corresponding IRQ for the onboard parallel port. The options are "Disabled", "**378/IRQ7**", "278/IRQ5" and "3BC/IRQ7".

Parallel Port Mode

This setting sets the mode for the onboard Parallel port. The options are "**SPP**," "EPP", "ECP" "ECP+EPP" and "Normal".

EPP Mode Select

This setting allows the user to select the EPP port type. The options are "EPP 1.9" and "**EPP 1.7**".

ECP Mode Use DMA

This setting allows the user to select the DMA channel for the ECP mode (port) to use. The options are "1" and "**3**".

Power On Function

This setting allows the user to decide which method to use to power on the system. The options are "Password", "Hot Key", "Mouse Left", "Mouse Right", "Any Key", and "**Button Only**".

KB Power On Password

This setting allows the user to enter the Password when the system is powered on via keyboard.

Hot Key Power On

This setting allows the user to decide which hot-keys to use in order to power on the system. The options are "**Ctrl-F1**", "Ctrl-F2, Ctrl-F3", "Ctrl-F4", "Ctrl-F5", "Ctrl-F6", "Ctrl-F7", and "Ctrl-F8".

4-4.4 PnP/PCI Configuration

Choose PCI/PnP Configurations from the Award BIOS main menu with the Left/Right arrow keys. You should see the following display:

```
              Phoenix - AwardBIOS CMOS Setup Utility
  Advanced

        PnP/PCI Configurations                   Item Help

   Init Display First         [PCI Slot]      Menu Level    ▶▶
   Reset Configuration Data   [Disabled]

   Resources Controlled By    [Auto(ESCD)]
 x IRQ Resources
   Onboard Lan Boot ROM       [Disabled]

   ** PCI Express relative items **
   Maximum Payload Size       [4096]
 ▶ PCI Express Root Port Func
   PCI X Frequency            [PCIX 100]

 ↑↓→←:Move  Enter:Select  +/-/PU/PD:Value  F10:Save  ESC:Exit  F1:General Help
      F5:Previous Values   F6:Fail-Safe Defaults   F7:Optimized Defaults
```

Initial Display From

This feature sets the device that will initiate the monitor display when the system is first turned on.   The options are "**PCI Slot**" and "PCI Ex(press)".

Reset Configuration Data

Enabling this setting resets the extended system configuration data when you exit setup. Do this when you have installed a new add-on and the system reconfiguration has caused such a serious conflict that the OS cannot reboot the system.   The options are "Enabled" and "**Disabled.**"

Resources Controlled By

This setting allows the BIOS to automatically configure all boot and Plug and Play compatible devices. If you choose Auto, you cannot select the IRQ, DMA and memory base address fields, because the BIOS automatically assigns them.   The options are "**Auto (ESCD)**" and "Manual".

IRQ Resources

If the above item-Resources Controlled By" is set to manual, the user is allowed to assign an IRQ to a PCI Device or Reserve an IRQ for other purpose. The options are: **Auto (ESCD)** and Manual.

IRQ-3,

IRQ-4,

IRQ-5,

IRQ-7,

IRQ-9,

IRQ-10,

IRQ-12,

IRQ-14,

IRQ-15

Onboard LAN Boot ROM

This feature allows the user to determine if the Boot ROMs of the Onboard LAN chips should be activated. If activated, the user can boot the system from the Onboard LAN chips. The options are Disabled, **LAN1**, LAN2 and Both.

Maximum Payload Size

This setting allows the BIOS to set the maximum TLP Payload size for the PCI Express devices in the system. The options are: "128 (bytes)", "256 (bytes)", "512 (bytes)", "1024 (bytes)", "2048 (bytes)", and "**4096 (bytes)**".

▶**PCI Express Root Port Function**

PCI Express Port 1/PCI Express Port 2/PCI Express Port 3/PCI Express Port 4

Select "Enabled" to enable the PCI Express Root Port Functions for the PCI Express port specified. The options are: "Disabled", "Enabled", and "**Auto**".

PCI-E Compliance Mode

This features allows the BIOS to set the version of PCI-E Compliance Mode for the system. The options are: "**v.1.0a**" and "v.1.0".

PCI-X Frequency

This features allows the user to configure the default setting for PCI-X Frequency. The options are: "Auto, PCI-33 MHz, PCI-66 MHz, PCIX-66 MHz, **PCI-X 100 MHz**, PCI-X 133 MHz."

4-4.5 Hardware Monitors

There are only three settings on this menu (below). The rest of this menu shows various temperatures and voltage levels as indicated.

CPU Warning Temperature

This allows you to set the CPU warning temperature. If the CPU temperature reaches this threshold, an alarm will activate and a warning message will be displayed onscreen. The options are "Disabled", "60^0C/140^0F", "65^0C/149^0F", "70^0C/158^0F", "**75^0C/167^0F**", "80^0C/176^0F" and "85^0C/185^0F". (*See the note below.)

Note: In the Windows OS environment, the Supero Doctor III settings take precedence over the BIOS settings. When first installed, the SD III adopts the temperature threshold settings previously set in the BIOS. Any subsequent changes to these thresholds must be made within Supero Doctor, since the SDIII settings override the BIOS settings. For the Windows OS to adopt the BIOS temperature threshold settings, please change the SDIII settings to be the same as those set in the BIOS.

Highlight this and hit <Enter> to see monitor data for the following items:

CPU Temperature:

System Temperature:

In addition to temperature monitoring, the status of the following items will also be displayed:

Fan 1 Speed-Fan 5 Speed

Voltage Monitoring

Processor Vcore (V), 3.3V Vcc (V), 5V Vcc (V), -12V Vcc (V), +12V Vcc (V), 5V Standby, VBAT

Fan Speed Control (Fan1-Fan5)

When set to 3-pin, the onboard fan speed is controlled by the CPU temperature. When the CPU temperature is higher, the fan speed will be higher as well. If set to "Disable," the fan speed control is disabled and the onboard fan will run at the full speed (12V) at all time. The options are: **"Disable"** and "3-pin Server".

4-4.6 Processor & Clock Options

```
             Phoenix - AwardBIOS CMOS Setup Utility
      Advanced

         Processor & Clock Option                Item Help

   Thermal Management        Thermal Monitor 1   Menu Level   ►►

   Hyper-Threading Technology[Enabled]           to 3,Should Be
   CPU Clock Ratio           [14 X]              "Disabled" for WinXp
   Spread Spectrum           [Disabled]

   ↑↓→←:Move  Enter:Select  +/-/PU/PD:Value  F10:Save  ESC:Exit  F1:General Help
        F5:Previous Values   F6:Fail-Safe Defaults   F7:Optimized Defaults
```

Thermal Management

This setting determines the method used by the BIOS to control the thermal management of the system. The options are "Thermal Monitor 1 (On die throttling) " and "**Thermal Monitor 2 (Ratio & VID transition)**." (See Section 1-4 for details.)

Limit CPUID MaxVal

Select "Enabled" to set CUPID maximum value to 3. Select "Disabled" for Windows XP OS. The options are "Enabled" and "**Disabled**."

Hyper-Threading

Set this option to "Enabled" to activate the hyper-threading function of the CPUs. Enabling the hyper-threading function makes each CPU appear as two to any programs that support it (you must have OS support also). The settings are "Disabled" and "**Enabled**."

CPU Clock Ration

Use this option to set the clock ratio of the processor. Use number keys to enter a number. *The default setting is "14".*

Spread Spectrum

Spread Spectrum is a technique used to stabilize a system by reducing the level of ElectroMagnetic Interference. The options are "Enabled" and "**Disabled**."

4-4.7 DMI Event Log
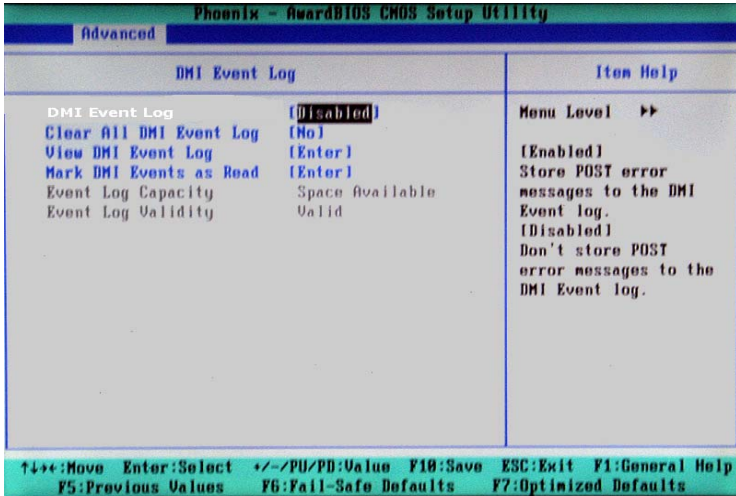

DMI Event Log

This setting allows you to Enable or Disable the function of DMI Event Logging. The options are **Disabled** and Enabled.

Clear All DMI Event Logs

Select Yes and press <Enter> to clear all DMI event logs. The default setting is **"No."**

View DMI Event Log

Highlight this item and press <Enter> to view the contents of the event log.

Mark DMI Events as Read

Highlight this item and press <Enter> to mark the DMI events as read.

Event Log Validity

This is a display to inform you of the event log validity. It is not a setting.

Event Log Capacity

This is a display to inform you of the event log capacity. It is not a setting.

4-4.8 Console Redirection
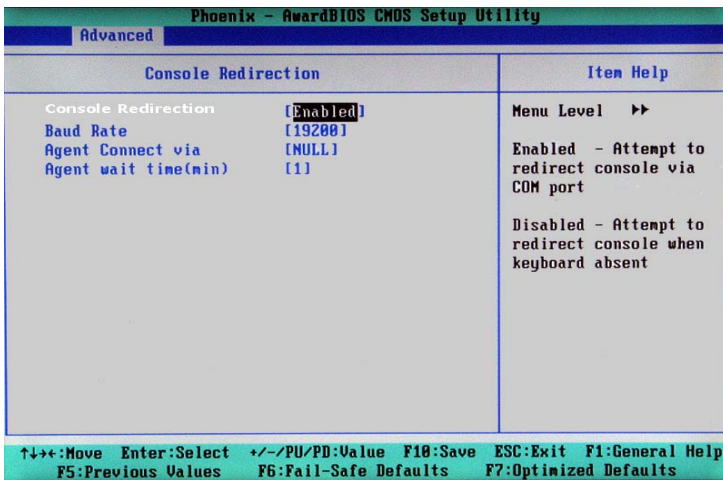

Console Redirection

This setting allows you to Enable or Disable the function of Console Redirection. The options are **Disabled** and Enabled.

BAUD Rate

Select the BAUD rate for console redirection. The options are 300, 1200, 2400, 9600, **19.2K**, 38.4K, 57.6K and 115.2K.

Agent Connect Via

This setting allows you to select the device to be used for Console Redirection.

Agent Wait Time (Min)

This setting allows you to set the wait time for the Console Redirection "Agent".   The options are **1 (Min),** 2 (Min), 4 (Min), and 8 (Min).

4-5   Security

Choose Security from the Award BIOS main menu with the Left/Right arrow keys. You should see the following display:
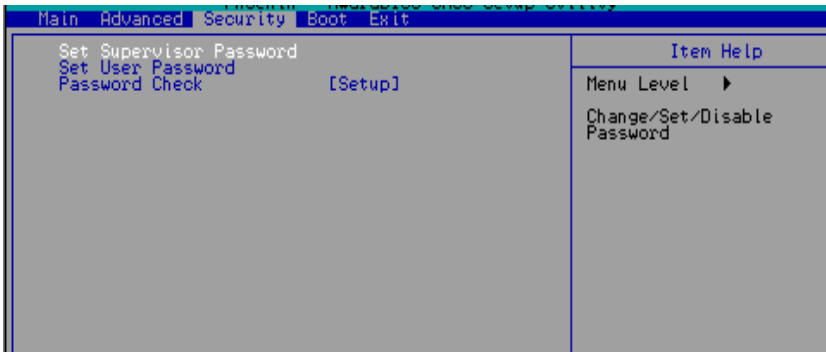

Set Supervisor Password

When the item "Set Supervisor Password" is highlighted on the above screen, press the <Enter> key. When prompted, type the Supervisor Password in the dialogue box to set or to change the Supervisor Password.

Set User Password

When the item "Set User Password" is highlighted on the above screen, press the <Enter> key. When prompted, type the User Password in the dialogue box to set or to change the User Password.

Password Check

This setting allows the user to determine if the password is required every time when the system boots up or if the password is required only when you enter the CMOS setup. The options are "System" and "**Setup**".

4-6   Boot

Choose Boot from the Award BIOS main menu with the Left/Right arrow keys. You should see the following display:

```
                Phoenix - AwardBIOS CMOS Setup Utility
      Main   Advanced   Security   Boot   Exit

                                                     Item Help
         ▶Removable Device Priority
         ▶Hard Disk Boot Priority           Menu Level    ▶
         ▶CD-ROM Boot Priority
                                             Select Hard Disk Boot
                                             Device Priority
          First Boot Device    [Floppy]
          Second Boot Device   [CDROM]
          Third Boot Device    [Hard Disk]
          Boot Other Device    [Enabled]

      ↑↓→←:Move  Enter:Select  +/-/PU/PD:Value  F10:Save  ESC:Exit  F1:General Help
           F5:Previous Values    F6:Fail-Safe Defaults    F7:Optimized Defaults
```
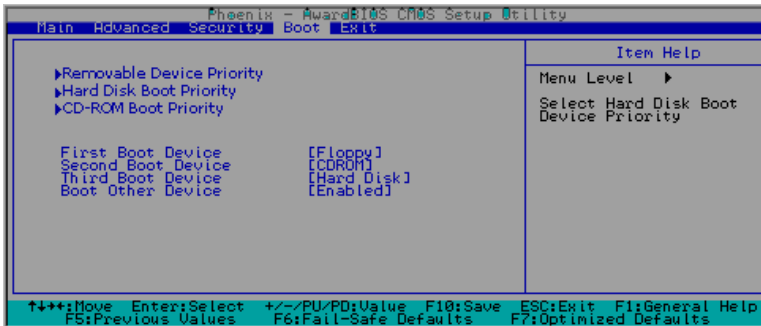

The Award BIOS attempts to load the operating system from devices specified by the users in a user-specified sequence.

Removable Device Boot Priority/Hard Drive Boot Priority/CD-ROM Boot Priority

This item allows the user to select the Boot Priority of Hard Disk Devices.

First Boot Device

This item allows the user to set the first boot-up device. The options are "**Floppy**", "LS120", "HDD", "CDROM", "ZIP100", "USB-FDD", "USB-ZIP", "USB-CDROM", "USB-HDD", "LAN" and "Disabled".

Second Boot Device

This item allows the user to set the second boot-up device. The options are "Floppy", "LS120", "HDD", "**CDROM**", "ZIP100", "USB-FDD", "USB-ZIP", "USB-CDROM", "USB-HDD", "LAN" and "Disabled".

Third Boot Device

This item allows the user to set the third boot-up device. The options are "Floppy", "LS120", "**HDD**", "SCSI", "CDROM", "ZIP100", "USB-FDD", "USB-ZIP", "USB-CDROM", "USB-HDD", "LAN" and "Disabled".

Boot Other Device

If enabled, this option enables the BIOS to load the OS from another device rather than the ones that have been specified as the first, second and third boot up devices. The settings are "**Enabled**" and "Disabled".

4-7   Exit

Choose Exit from the Award BIOS main menu with the Left/Right arrow keys. You should see the following display:
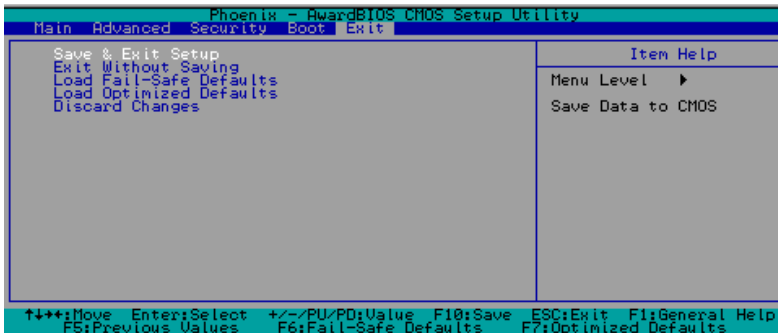

Save & Exit Setup

When the item "Save & Exit Setup" is highlighted, press <Enter> to save the changes you've made in the BIOS program (CMOS) and exit. Your system should, then, continue with the boot-up procedure.

Exit without Saving

When the item "Exit without Saving" is highlighted, press <Enter> to exit the Setup routine without saving any changes you may have made. Your system should then continue with the boot-up procedure.

Load Fail-Safe Defaults

Highlight this item and hit <Enter> to load the default settings for all items in the BIOS Setup. These are the safest settings to use.

Load Optimized Defaults

Highlight this item and hit <Enter> to load the optimized settings for all items in the BIOS Setup. These settings provide you with optimal system performance.

Discard Changes

When the item "Discard Changes" is highlighted, press <Enter> to discard any changes you made to the BIOS settings and to stay in the BIOS Setup. Your system should then continue with the boot-up procedure.

Appendix A
BIOS POST Messages

During the Power-On Self-Test (POST), the BIOS will check for problems. If a problem is found, the BIOS will activate an alarm or display a message. The following is a list of such BIOS messages.

Beeps	Error Messages
(1 long beep+1 short pause) continuously	Memory Modules Errors
1 long beep+2 short beeps	VGA Errors

Notes

Appendix B: Award BIOS POST Codes

This section lists the POST (Power On Self Testing) Codes for the Award BIOS.

POST (hex)	Description
CFh	Test CMOS R/W functionality.
C0h	Early chipset initialization: -Disable shadow RAM -Disable L2 cache (socket 7 or below) -Program basic chipset registers
C1h	Detect memory -Auto-detection of DRAM size, type and ECC. -Auto-detection of L2 cache (socket 7 or below)
C3h	Expand compressed BIOS code to DRAM
C5h	Call chipset hook to copy BIOS back to E000 & F000 shadow RAM.
0h1	Expand the Xgroup codes locating in physical address 1000:0
02h	Reserved
03h	Initial Superio_Early_Init switch.
04h	Reserved
05h	1. Blank out screen 2. Clear CMOS error flag
06h	Reserved
07h	1. Clear 8042 interface 2. Initialize 8042 self-test
08h	1. Test special keyboard controller for Winbond 977 series Super I/O chips. 2. Enable keyboard interface.
09h	Reserved
0Ah	● Disable PS/2 mouse interface (optional). ● Auto detect ports for keyboard & mouse followed by a port & interface swap (optional). ● Reset keyboard for Winbond 977 series Super I/O chips.
0Bh	Reserved
0Ch	Reserved
0Dh	Reserved
0Eh	Test F000h segment shadow to see whether it is R/W-able or not. If test fails, keep beeping the speaker.

POST (hex)   **Description**

POST (hex)	Description
0Fh	Reserved
10h	Auto detect flash type to load appropriate flash R/W codes into the run time area in F000 for ESCD & DMI support.
11h	Reserved
12h	Use walking 1's algorithm to check out interface in CMOS circuitry. Also set real-time clock power status, and then check for override.
13h	Reserved
14h	Program chipset default values into chipset. Chipset default values are MODBINable by OEM customers.
15h	Reserved
16h	Initial Early_Init_Onboard_Generator switch.
17h	Reserved
18h	Detect CPU information including brand, SMI type (Cyrix or Intel) and CPU level (586 or 686).
19h	Reserved
1Ah	Reserved
1Bh	Initial interrupts vector table. If no special specified, all H/W interrupts are directed to SPURIOUS_INT_HDLR & S/W interrupts to SPURIOUS_soft_HDLR.
1Ch	Reserved
1Dh	Initial EARLY_PM_INIT switch.
1Eh	Reserved
1Fh	Load keyboard matrix (notebook platform)
20h	Reserved
21h	HPM initialization (notebook platform)
22h	Reserved
23h	1. Check validity of RTC value: e.g. a value of 5Ah is an invalid value for RTC minute. 2. Load CMOS settings into BIOS stack. If CMOS checksum fails, use default value instead. 3. Prepare BIOS resource map for PCI & PnP use. If ESCD is valid, take into consideration of the ESCD's legacy information. 4. Onboard clock generator initialization. Disable respective clock resource to empty PCI & DIMM slots. 5. Early PCI initialization: -Enumerate PCI bus number -Assign memory & I/O resource -Search for a valid VGA device & VGA BIOS, and put it into C000:0.
24h	Reserved
25h	Reserved
26h	Reserved
27h	Initialize INT 09 buffer
28h	Reserved
29h	● Program CPU internal MTRR (P6 & PII) for 0-640K memory address. ● Initialize the APIC for Pentium class CPU. ● Program early chipset according to CMOS setup. Example: onboard IDE controller. ● Measure CPU speed. ● Invoke video BIOS.
2Ah	Reserved
2Bh	Reserved
2Ch	Reserved

POST (hex)	Description
2Dh	1. Initialize multi-language 2. Put information on screen display, including Award title, CPU type, CPU speed ….
2Eh	Reserved
2Fh	Reserved
30h	Reserved
31h	Reserved
32h	Reserved
33h	Reset keyboard except Winbond 977 series Super I/O chips.
34h	Reserved
35h	Reserved
36h	Reserved
37h	Reserved
38h	Reserved
39h	Reserved
3Ah	Reserved
3Bh	Reserved
3Ch	Test 8254
3Dh	Reserved
3Eh	Test 8259 interrupt mask bits for channel 1.
3Fh	Reserved
40h	Test 8259 interrupt mask bits for channel 2.
41h	Reserved
42h	Reserved
43h	Test 8259 functionality.
44h	Reserved
45h	Reserved
46h	Reserved
47h	Initialize EISA slot
48h	Reserved
49h	1. Calculate total memory by testing the last double word of each 64K page. 2. Program writes allocation for AMD K5 CPU.
4Ah	Reserved
4Bh	Reserved
4Ch	Reserved
4Dh	Reserved
4Eh	1. Program MTRR of M1 CPU 2. Initialize L2 cache for P6 class CPU & program CPU with proper cacheable range. 3. Initialize the APIC for P6 class CPU. 4. On MP platform, adjust the cacheable range to smaller one in case the cacheable ranges between each CPU are not identical.
4Fh	Reserved
50h	Initialize USB
51h	Reserved
52h	Test all memory (clear all extended memory to 0)
53h	Reserved
54h	Reserved
55h	Display number of processors (multi-processor platform)
56h	Reserved
57h	1. Display PnP logo 2. Early ISA PnP initialization -Assign CSN to every ISA PnP device.

POST (hex)   **Description**

58h	Reserved
59h	Initialize the combined Trend Anti-Virus code.
5Ah	Reserved
5Bh	(Optional Feature) Show message for entering AWDFLASH.EXE from FDD (optional)
5Ch	Reserved
5Dh	1. Initialize Init_Onboard_Super_IO switch. 2. Initialize Init_Onboard_AUDIO switch.
5Eh	Reserved
5Fh	Reserved
60h	Okay to enter Setup utility; i.e. not until this POST stage can users enter the CMOS setup utility.
61h	Reserved
62h	Reserved
63h	Reserved
64h	Reserved
65h	Initialize PS/2 Mouse
66h	Reserved
67h	Prepare memory size information for function call: INT 15h ax=E820h
68h	Reserved
69h	Turn on L2 cache
6Ah	Reserved
6Bh	Program chipset registers according to items described in Setup & Auto-configuration table.
6Ch	Reserved
6Dh	1. Assign resources to all ISA PnP devices. 2. Auto assign ports to onboard COM ports if the corresponding item in Setup is set to "AUTO".
6Eh	Reserved
6Fh	1. Initialize floppy controller 2. Set up floppy related fields in 40:hardware.
70h	Reserved
71h	Reserved
72h	Reserved
73h	(Optional Feature) Enter AWDFLASH.EXE if : -AWDFLASH is found in floppy drive. -ALT+F2 is pressed
74h	Reserved
75h	Detect & install all IDE devices: HDD, LS120, ZIP, CDROM…..
76h	Reserved
77h	Detect serial ports & parallel ports.
78h	Reserved
79h	Reserved
7Ah	Detect & install co-processor
7Bh	Reserved
7Ch	Reserved
7Dh	Reserved
7Eh	Reserved
7Fh	1. Switch back to text mode if full screen logo is supported. -If errors occur, report errors & wait for keys -If no errors occur or F1 key is pressed to continue: ◆Clear EPA or customization logo.

POST (hex)   **Description**

POST (hex)	Description
80h	Reserved
81h	Reserved
82h	1. Call chipset power management hook. 2. Recover the text font used by EPA logo (not for full screen logo) 3. If password is set, ask for password.
83h	Save all data in stack back to CMOS
84h	Initialize ISA PnP boot devices
85h	1. USB final Initialization 2. NET PC: Build SYSID structure 3. Switch screen back to text mode 4. Set up ACPI table at top of memory. 5. Invoke ISA adapter ROMs 6. Assign IRQs to PCI devices 7. Initialize APM 8. Clear noise of IRQs.
86h	Reserved
87h	Reserved
88h	Reserved
89h	Reserved
90h	Reserved
91h	Reserved
92h	Reserved
93h	Read HDD boot sector information for Trend Anti-Virus code
94h	1. Enable L2 cache 2. Program boot up speed 3. Chipset final initialization. 4. Power management final initialization 5. Clear screen & display summary table 6. Program K6 write allocation 7. Program P6 class write combining
95h	1. Program daylight saving 2. Update keyboard LED & typematic rate
96h	1. Build MP table 2. Build & update ESCD 3. Set CMOS century to 20h or 19h 4. Load CMOS time into DOS timer tick 5. Build MSIRQ routing table.
FFh	Boot attempt (INT 19h)

NOTES

Appendix C

Installing Software Programs and Drivers

(*Note: if you do not wish to configure onboard SATA RAID functions, please go directly to Section C-5 on Page C-22 for Operating System & Other Software Installation.)

After all the hardware has been installed, you must first configure Intel's ICH6R SATA RAID (*Note) before you install the Windows Operating System, and other software drivers. The necessary drivers are all included on the Supermicro CDs that came packaged with your motherboard.

C-1 Configuring Intel ICH6R SATA RAID Function

To configure SATARAID functions, you must first configure the RAID Level that you desire in the Intel ICH6R SATA RAID Utility program before you install the Windows XP/2000 operating system, and other software drivers. The necessary drivers are all included on the Supermicro CDs that came packaged with your motherboard. (*Note: the current version of ICH6R SATA RAID Utility can only support Windows XP/2000 Operating System.)

Serial ATA (SATA)

Serial ATA(SATA) is a physical storage interface. It uses a single cable with a minimum of four wires to create a point-to-point connection between devices. It is a serial link which supports SATA Transfer rates up to 150MBps. Because the serial cables used in SATA are thinner than the traditional cables used in

Parallel ATA(PATA), SATA systems have better airflow and can be installed in smaller chassis than Parallel ATA. In addition, the cables used in PATA can only extend to 40cm long, while Serial ATA cables can extend up to one meter. Overall, Serial ATA provides better functionality than Parallel ATA.

Introduction to Intel ICH6R SerialRAID

Located in the South Bridge of the E7221 Copper River Chipset, the I/O Controller Hub (ICH6R) provides the I/O subsystem with access to the rest of the system. It supports one-channel Ultra ATA/100 Bus Master IDE controller (PATA) and Serial ATA (SATA) Host Controller, which supports up to four Serial ATA ports and up to two sets of RAID drives. The ICH6R supports the following Parallel ATA (PATA) and Serial (SATA) device configurations:

ATA Operation Modes

You can select from the following two modes: Legacy mode and Native mode.

SATA Operate Modes

You can select from the following modes: Auto, Combined, Enhanced, and SATA Only Mode. The number of devices supported by these modes are listed below:

*SATA Only: The maximum of 4 devices are supported (4 SATA)
*Auto Mode: The maximum of 6 devices supported (4 SATA + 2 IDE)
*Enhanced Mode: The maximum of 6 devices supported (4 SATA + 2 IDE)
*Combined Mode: The maximum of 4 devices supported (2 SATA + 2 IDE)

Configuring BIOS settings for SATA RAID Functions (Native Mode)

1. Press the <Del> key during system bootup to enter the BIOS Setup Utility.

(*Note: If it is the first time powering on the system, we recommend you load Optimized Default Settings. If you have already done so, please skip to Step 3.

2. Use the arrow keys to select the "Exit" Settings . Once in the "Exit" settings, Scroll down to select the item- "Load Optimized Default settings" and press the <Enter> key. Select "OK" to confirm the selection. Press the <Enter> key to load the default settings for the BIOS.

3. Use the arrow keys to select the "Advanced" in the BIOS.

4. Scroll down to the item-"Advanced Chipset Control" and press the <Enter> Key to select this option.

5. Select the item- "On-Chip Serial ATA", and press the <Enter> Key. When the sub-menu appears, select the item-"Enhanced Mode".

6. Scroll up to the item- "SATA Mode", and press the <Enter> Key to select this option. When the sub-menu appears, select the item-"RAID".

7. Tap "Esc" and scroll down to "Exit". Select "Save and Exit" from the "Exit" menu. Press the <Enter> key to save the changes and exit the BIOS.

8. Once you've exited the BIOS Utility, the system will re-boot.

Using Intel ICH6R SATA RAID Utility Program

1. Creating, Deleting and Reseting RAID Volumes:

a. After the system exits from the BIOS Setup Utility, the system will automatically reboot. The following screen appears after Power-On Self Test.

```
  Intel(R) RAID for Serial ATA - RAID BIOS v3.0.0.2307
  Copyright(C) 2003 Intel Corporation.  All Rights Reserved.

  RAID Volumes:
  None defined.

  Non-RAID Disks:
  Port Drive Model     Serial #        Size      Status      Bootable
   0   ST3120023AS     3KA0J1ZJ       111.7GB    Normal        Yes
   1   ST3120023AS     3KA0H0M0       111.7GB    Normal        Yes
Press <CTRL-I> to enter Configuration Utility…
```

b. When you see the above screen, press the <Ctrl> and the <i> keys simultaneously, the following screen of the main menu of the SATA RAID Utility will appear:

```
        Intel(R) RAID for Serial ATA - RAID Configuration Utility
     Copyright(C) 2003 Intel Corporation.  All Rights Reserved. v3.0.0.2307
                        =[ MAIN MENU ]=
                    1.   Create RAID Volume
                    2.   Delete RAID Volume
                    3.   Reset Disks to Non-RAID
                    4.   Exit

                    =[ DISK/VOLUME INFORMATION ]=
     RAID Volumes:
     None defined.

     Non-RAID Disks:
     Port Drive Model    Serial #        Size      Status      Bootable
        0 ST3120023AS    3KA0J1ZJ       111.7GB    Normal        Yes
        1 ST3120023AS    3KA0H0M0       111.7GB    Normal        Yes

         [↑↓]-Select            [ESC]-Exit         [ENTER]-Select Menu
```
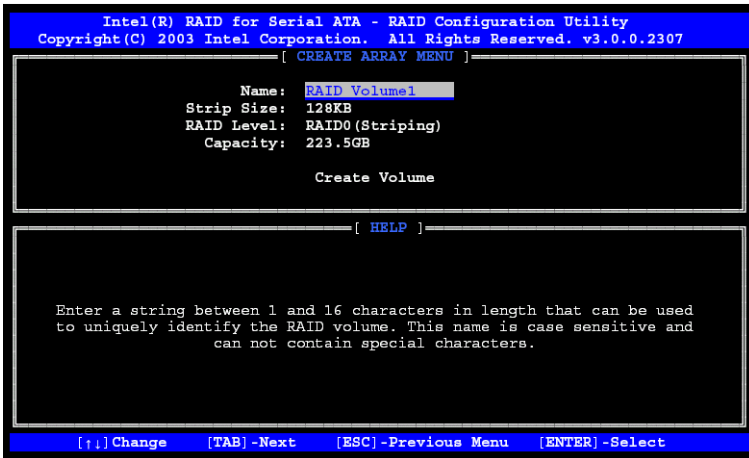

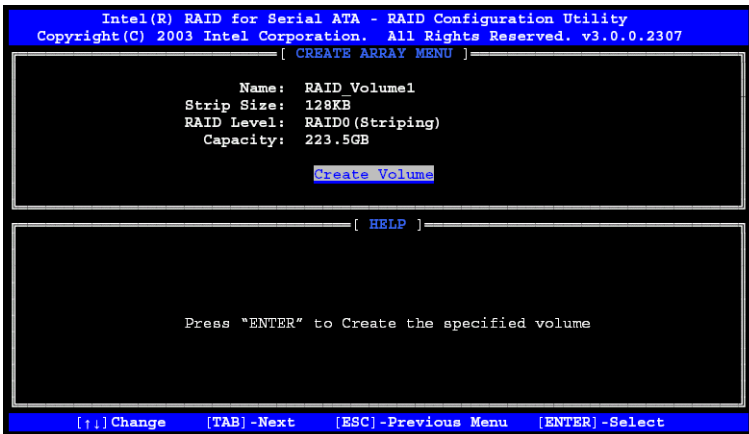

Creating RAID Volume:

a. Select Item #1- "Create RAID Volume" from the main menu and press the <Enter> key. The following screen will appear:

```
        Intel(R) RAID for Serial ATA - RAID Configuration Utility
    Copyright(C) 2003 Intel Corporation.  All Rights Reserved. v3.0.0.2307
    =========================[ CREATE ARRAY MENU ]=========================

                    Name:  RAID_Volume1
              Strip Size:  128KB
              RAID Level:  RAID0(Striping)
                Capacity:  223.5GB

                           Create Volume

    ================================[ HELP ]================================

        Enter a string between 1 and 16 characters in length that can be used
        to uniquely identify the RAID volume. This name is case sensitive and
                        can not contain special characters.

        [↑↓]Change      [TAB]-Next    [ESC]-Previous Menu    [ENTER]-Select
```

b. Specify a RAID Volume Name and press the <Tab> key or the <Enter> key to go to the next field. (*Note: You can use the <Esc> key to select the previous menu.)

c.Use the<Tab>, <Upper Arrow>, <Down Arrow> and <Enter> keys to enter the appropriate values for the items selected and go to the next field.

```
        Intel(R) RAID for Serial ATA - RAID Configuration Utility
    Copyright(C) 2003 Intel Corporation.  All Rights Reserved. v3.0.0.2307
    =========================[ CREATE ARRAY MENU ]=========================

                    Name:  RAID_Volume1
              Strip Size:  128KB
              RAID Level:  RAID0(Striping)
                Capacity:  223.5GB
                           Create Volume

    ================================[ HELP ]================================

                Press "ENTER" to Create the specified volume

        [↑↓]Change      [TAB]-Next    [ESC]-Previous Menu    [ENTER]-Select
```

d. When asked "Are you sure you want to create this volume (Y/N), press "Y" to confirm the selection, or type "N" to change and to create the RAID volume. Then, press the <Enter> key to enter the value and return to the main menu.
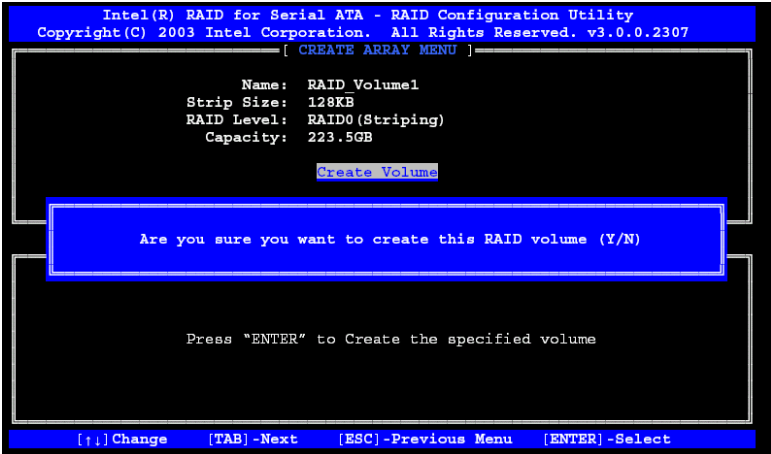

e. You will return to the main menu with DISK/VOLUME INFORMATION updated as shown in the following screen.
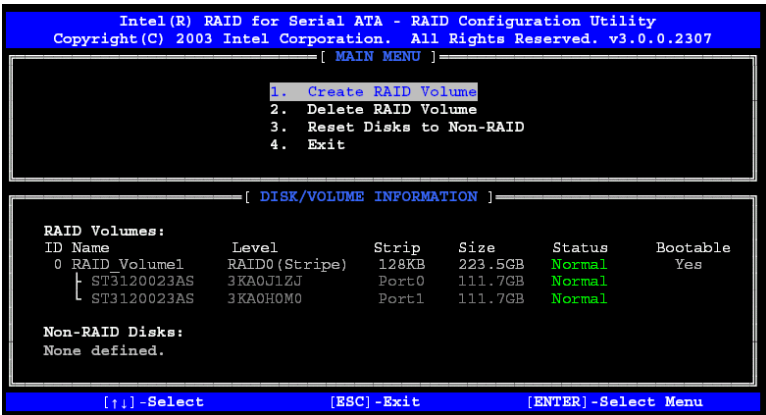

f. Once the above screen appears, use the <Down Arrow> key to select item#4-"Exit" and press the <Enter> key. The following screen will appear:

```
         Intel(R) RAID for Serial ATA - RAID Configuration Utility
      Copyright(C) 2003 Intel Corporation.  All Rights Reserved. v3.0.0.2307
  ═══════════════════════════[ MAIN MENU ]═══════════════════════════

                        1.    Create RAID Volume
                        2.    Delete RAID Volume
                        3.    Reset Disks to Non-RAID
                        4.    Exit

    Non-RAID Disks:
    None defined.

        [↑↓]-Select          [ESC]-Exit         [ENTER]-Select Menu
```

c.When asked "Are you sure you want to reset all RAID data (Y/N):", type "Y" to confirm the selection, and press the <Enter> key to return to the main menu. (*Press the <Esc> key to select the previous menu.)

2. Exiting the ICH6R SATA RAID Configuration Utility Program:

a. When you are in the main menu, use the <Down Arrow> and the <Upper Arrow> keys to select item#4-"Exit" in the main menu.

b When the item# 4 "Exit" is highlighted, press the <Enter> key.

c.When asked "Are you sure you want to exit? (Y/N):" Type "Y" to confirm the selection, and press the <Enter> key to exit the ICH6R SATA RAID Configuration Utility Program. The system will start to re-boot.

C-2 Installing the Windows XP/2000 for systems with RAID   Functions

New Operating System-Windows XP/2000 Installation

a. Insert Microsoft Windows XP/2000 Setup CD in the CD Driver, and the system will start booting up from CD.

b. Press the <F6> key when the message-" Press F6 if you need to install a third party SCSI or RAID driver" displays.

c. When the Windows XP/2000 Setup screen appears, press "S" to specify additional device(s).

d. Insert the driver diskette-"Intel AA RAID XP/2000 Driver for ICH6R into Drive A: and press the <Enter> key.

e. Choose Intel(R)82801ER *SATA RAID Controller* from the list indicated in the XP/2000 Setup Screen, and press the <Enter> key.

f. Press the <Enter> key to continue the installation process. (If you need to specify any additional devices to be installed, do it at this time.) Once all devices are specified, press the <Enter> key to continue with the installation.

g. From the Windows XP/2000 Setup screen, press the <Enter> key. The XP/2000 Setup will automatically load all device files and then, continue the Windows XP/2000 installation.

(*Note: the current version of the ICH6R SATA RAID Utility can only support Windows XP/2000 Operating System.)

h. After Windows XP/2000 Installation is completed, the system will automatically reboot.

i. Insert Supermicro CD that came with the package into the CD Drive during system reboot, and the following screen will appear:
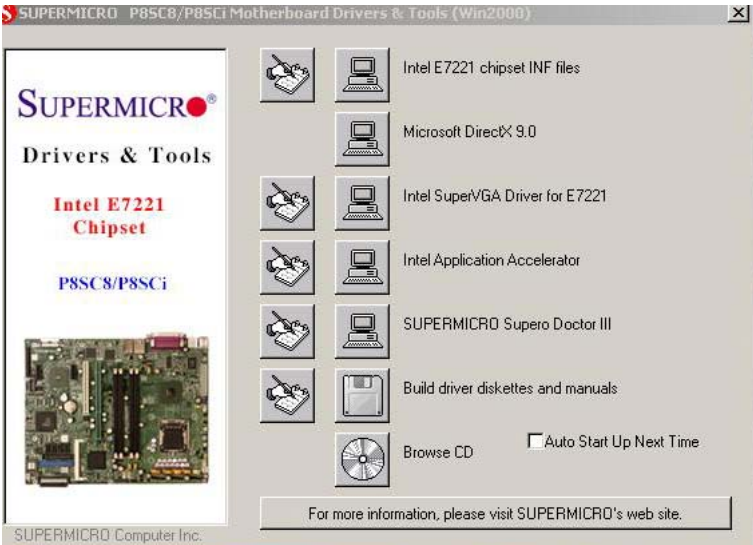

(*Note: Click the icons showing a hand writing on paper to view the readme files for each item. Click the computer icons to the right of these items to install each item (from top to the bottom) one at a time. **After installing each item, you must re-boot the system before moving on to the next item on the list.** You should install everything here except for the SUPER Doctor utility and the LAN/SCSI driver diskettes, which are optional. The bottom icon with a CD on it allows you to view the entire contents of the CD.)

Installing Intel Application Accelerator Utility

a. When the above screen appears, click on the icon marked "Application Accelerator RAID Edition" on the screen, and the following screen will appear:
b. When the above screen appears, click on the icon marked "Next" on the screen, and the following screen will appear:
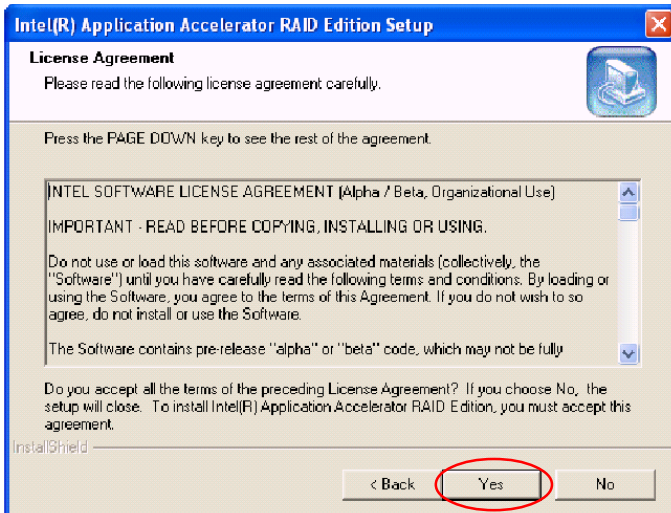

c. After reading the License Agreement, click on the icon marked "Yes" on the screen, and the following screen will appear:

d. Specify the folder that you want the program to be installed in and then, click on the icon marked "Next" to begin the installation process.
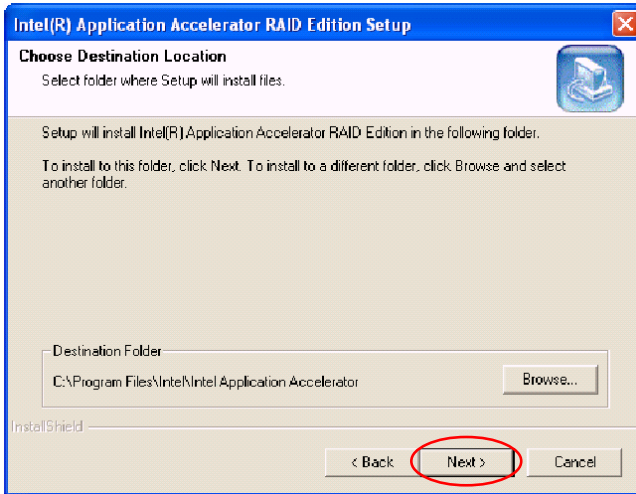

e. Specify a program folder where you want the Setup to add the program icon as shown in the following screen and click on the icon marked "Next".
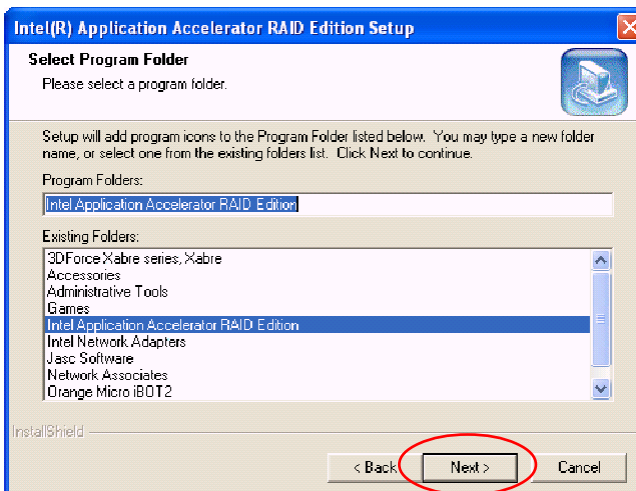

f. The following screen will appear to display the status of the Intel Application Accelerator RAID Edition Installation.
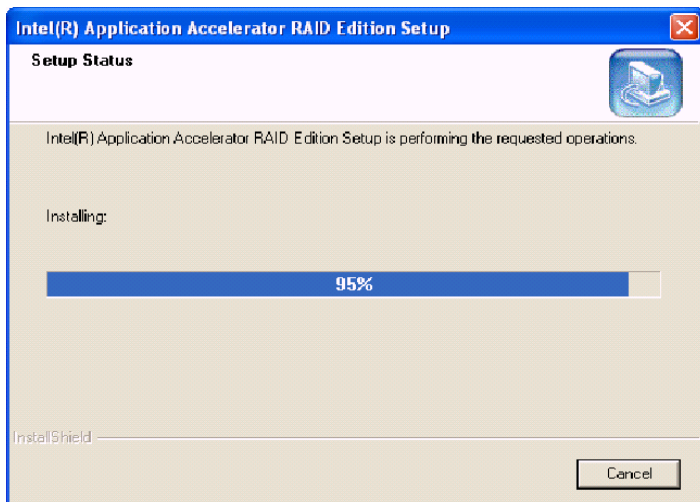

g. Once the Application Accelerator RAID Edition installation is completed, the following screen will appear and the system will start to re-boot.
(*Note: Once the XP/2000 Operating System is installed, please read the "Readme text files" for the instructions to use the SATA RAID Utility in the Windows XP/2000 OS environment.)

C-5 Installing the Operating System and other Software Programs

After all the hardware has been installed, you must first install the operating system, and then, other software drivers. The necessary drivers are all included on the Supermicro CDs that came packaged with your motherboard. (*Note: for the Windows 2003 OS, please refer to Page C-14.)
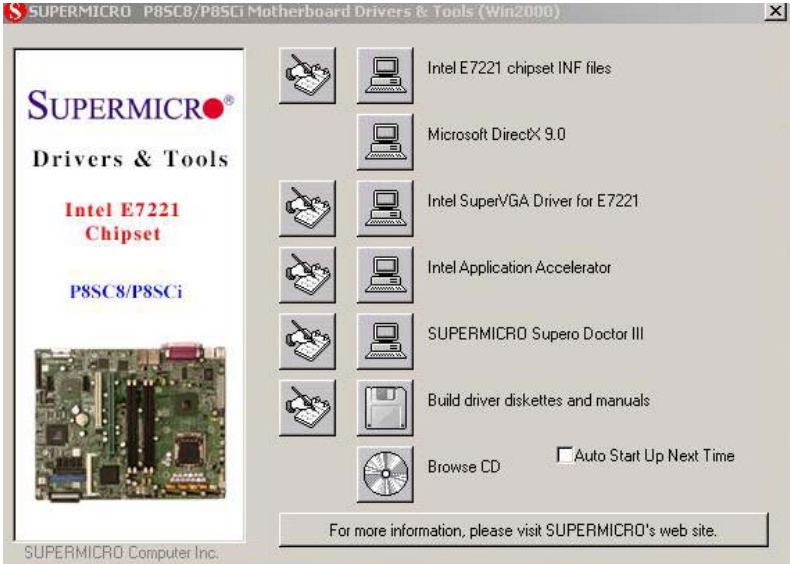

Driver/Tool Installation Display Screen

(*Note: Click the icons showing a hand writing on the paper to view the readme files for each item. Click the computer icons to the right of these items to install each item (from top to the bottom) one at a time. **After installing each item, you must re-boot the system before moving on to the next item on the list.** The bottom icon with a CD on it allows you to view the entire contents of the CD.)

Supero Doctor III

The Supero Doctor III program is a Web base management tool that supports remote management capability. It includes Remote and Local Management tools. The local management is called SD III Client. The Supero Doctor III program included on the CDROM that came with your motherboard allows you to monitor the environment and operations of your system. Supero Doctor III displays crucial system information such as CPU temperature, system voltages and fan status. See the Figure below for a display of the Supero Doctor III interface.

Note 1: The default user name and password are ADMIN.

Note 2: In the Windows OS environment, the Supero Doctor III settings take precedence over the BIOS settings. When first installed, the SD III adopts the temperature threshold settings previously set in the BIOS. Any subsequent changes to these thresholds must be made within Supero Doctor, since the SDIII settings override the BIOS settings. For the Windows OS to adopt the BIOS temperature threshold settings, please change the SDIII settings to be the same as those set in the BIOS.

Supero Doctor III Interface Display Screen-I (Health Information)

Supero Doctor III Interface Display Screen-II (Remote Control)

(*Note: SD III Software Revision 1.0 can be downloaded from our Website at: ftp://ftp.supermicro.com/utility/Supero_Doctor_III/. You can also download SDIII User's Guide at: http://www.supermicro.com/PRODUCT/Manuals/SDIII/UserGuide.pdf. For Linux, we will still recommend Supero Doctor II.)
